(71) Applicant (for all designated States except US): CURAGEN CORPORATION [US/US]; 11th Floor, 555 Long Wharf Drive, New Haven, CT 06511 (US).

(54) Title: NOVEL ANTIBODIES THAT BIND TO ANTIGENIC POLYPEPTIDES, NUCLEIC ACIDS ENCODING THE ANTIGENS, AND METHODS OF USE

(57) Abstract: Disclosed herein are nucleic acid sequences that encode polypeptides. Also disclosed are antibodies, which immunospecifically-bind to the polypeptide, as well as derivatives, variants, mutants, or fragments of the aforementioned polypeptide, polynucleotide, or antibody. The invention further discloses therapeutic, diagnostic and research methods for diagnosis, treatment, and prevention of disorders involving any one of these novel human nucleic acids, polypeptides, or antibodies, or fragments thereof.

NOVEL ANTIBODIES THAT BIND TO ANTIGENIC POLYPEPTIDES, NUCLEIC ACIDS ENCODING THE ANTIGENS, AND METHODS OF USE

FIELD OF THE INVENTION

5   The present invention relates to novel antibodies that bind immunospecifically to antigenic polypeptides, wherein the polypeptides have characteristic properties related to biochemical or physiological responses in a cell, a tissue, an organ or an organism. The novel polypeptides are gene products of novel genes, or are specified biologically active fragments or derivatives thereof. Methods of use of the antibodies encompass procedures for

10   diagnostic and prognostic assay of the polypeptides, as well as methods of treating diverse pathological conditions.

BACKGROUND OF THE INVENTION

       Eukaryotic cells are characterized by biochemical and physiological processes which under normal conditions are exquisitely balanced to achieve the preservation and propagation

15   of the cells. When such cells are components of multicellular organisms such as vertebrates, or more particularly organisms such as mammals, the regulation of the biochemical and physiological processes involves intricate signaling pathways. Frequently, such signaling pathways involve extracellular signaling proteins, cellular receptors that bind the signaling proteins, and signal transducing components located within the cells.

20   Signaling proteins may be classified as endocrine effectors, paracrine effectors or autocrine effectors. Endocrine effectors are signaling molecules secreted by a given organ into the circulatory system, which are then transported to a distant target organ or tissue. The target cells include the receptors for the endocrine effector, and when the endocrine effector binds, a signaling cascade is induced. Paracrine effectors involve secreting cells and receptor

25   cells in close proximity to each other, for example two different classes of cells in the same tissue or organ. One class of cells secretes the paracrine effector, which then reaches the second class of cells, for example by diffusion through the extracellular fluid. The second class of cells contains the receptors for the paracrine effector; binding of the effector results in induction of the signaling cascade that elicits the corresponding biochemical or

30   physiological effect. Autocrine effectors are highly analogous to paracrine effectors, except that the same cell type that secretes the autocrine effector also contains the receptor. Thus the autocrine effector binds to receptors on the same cell, or on identical neighboring cells. The binding process then elicits the characteristic biochemical or physiological effect.

       Signaling processes may elicit a variety of effects on cells and tissues including by

35   way of nonlimiting example induction of cell or tissue proliferation, suppression of growth or

proliferation, induction of differentiation or maturation of a cell or tissue, and suppression of differentiation or maturation of a cell or tissue.

Many pathological conditions involve dysregulation of expression of important effector proteins. In certain classes of pathologies the dysregulation is manifested as elevated
5   or excessive synthesis and secretion of protein effectors. In a clinical setting a subject may be suspected of suffering from a condition brought on by elevated or excessive levels of a protein effector of interest.

Antibodies are multichain proteins that bind specifically to a given antigen, and bind poorly, or not at all, to substances deemed not to be cognate antigens. Antibodies are
10   comprised of two short chains termed light chains and two long chains termed heavy chains. These chains are constituted of immunoglobulin domains, of which generally there are two classes: one variable domain per chain, one constant domain in light chains, and three or more constant domains in heavy chains. The antigen-specific portion of the immunoglobulin molecules resides in the variable domains; the variable domains of one light chain and one
15   heavy chain associate with each other to generate the antigen-binding moiety. Antibodies that bind immunospecifically to a cognate or target antigen bind with high affinities. Accordingly, they are useful in assaying specifically for the presence of the antigen in a sample. In addition, they have the potential of inactivating the activity of the antigen.

Therefore there is a need to assay for the level of a protein effector of interest in a
20   biological sample from such a subject, and to compare this level with that characteristic of a nonpathological condition. In particular, there is a need for such an assay based on the use of an antibody that binds immunospecifically to the antigen. There further is a need to inhibit the activity of the protein effector in cases where a pathological condition arises from elevated or excessive levels of the effector based on the use of an antibody that binds
25   immunospecifically to the effector. Thus, there is a need for the antibody as a product of manufacture. There further is a need for a method of treatment of a pathological condition brought on by an elevated or excessive level of the protein effector of interest based on administering the antibody to the subject.

30   SUMMARY OF THE INVENTION

The invention is based in part upon the discovery of nucleic acid sequences encoding novel polypeptides. The novel nucleic acids and polypeptides are referred to herein as NOVX, or NOV1, NOV2, NOV3, *etc.*, nucleic acids and polypeptides. These nucleic acids

2

and polypeptides, as well as derivatives, homologs, analogs and fragments thereof, will

hereinafter be collectively designated as "NOVX" nucleic acid or polypeptide sequences.

In one aspect, the invention provides an isolated polypeptide comprising a mature

form of a NOVX amino acid. The polypeptide can be, for example, a NOVX amino acid

5   sequence or a variant of a NOVX amino acid sequence, wherein any amino acid specified in

the chosen sequence is changed to a different amino acid, provided that no more than 15% of

the amino acid residues in the sequence are so changed. The invention also includes

fragments of any of NOVX polypeptides. In another aspect, the invention also includes an

isolated nucleic acid that encodes a NOVX polypeptide, or a fragment, homolog, analog or

10   derivative thereof.

Also included in the invention is a NOVX polypeptide that is a naturally occurring

variant of a NOVX sequence. In one embodiment, the variant includes an amino acid

sequence that is the translation of a nucleic acid sequence differing by a single nucleotide

from a NOVX nucleic acid sequence. In another embodiment, the NOVX polypeptide is a

15   variant polypeptide described therein, wherein any amino acid specified in the chosen

sequence is changed to provide a conservative substitution.

In another aspect, invention provides a method for determining the presence or

amount of the NOVX polypeptide in a sample by providing a sample; introducing the sample

to an antibody that binds immunospecifically to the polypeptide; and determining the

20   presence or amount of antibody bound to the NOVX polypeptide, thereby determining the

presence or amount of the NOVX polypeptide in the sample.

In yet another aspect, the invention includes a method for determining the presence of

or predisposition to a disease associated with altered levels of a NOVX polypeptide in a

mammalian subject by measuring the level of expression of the polypeptide in a sample from

25   the first mammalian subject; and comparing the amount of the polypeptide in the sample of

the first step to the amount of the polypeptide present in a control sample from a second

mammalian subject known not to have, or not to be predisposed to, the disease. An alteration

in the expression level of the polypeptide in the first subject as compared to the control

sample indicates the presence of or predisposition to the disease.

30   In another aspect, the invention includes pharmaceutical compositions that include

therapeutically- or prophylactically-effective amounts of a therapeutic and a

pharmaceutically-acceptable carrier. The therapeutic can be, *e.g.*, a NOVX nucleic acid, a

NOVX polypeptide, or an antibody specific for a NOVX polypeptide. In a further aspect, the

3

invention includes, in one or more containers, a therapeutically- or prophylactically-effective amount of this pharmaceutical composition.

In still another aspect, the invention provides the use of a therapeutic in the manufacture of a medicament for treating a syndrome associated with a human disease that is associated with a NOVX polypeptide.

In a further aspect, the invention provides a method for modulating the activity of a NOVX polypeptide by contacting a cell sample expressing the NOVX polypeptide with antibody that binds the NOVX polypeptide in an amount sufficient to modulate the activity of the polypeptide.

The invention also includes an isolated nucleic acid that encodes a NOVX polypeptide, or a fragment, homolog, analog or derivative thereof. In a preferred embodiment, the nucleic acid molecule comprises the nucleotide sequence of a naturally occurring allelic nucleic acid variant. In another embodiment, the nucleic acid encodes a variant polypeptide, wherein the variant polypeptide has the polypeptide sequence of a naturally occurring polypeptide variant. In another embodiment, the nucleic acid molecule differs by a single nucleotide from a NOVX nucleic acid sequence. In one embodiment, the NOVX nucleic acid molecule hybridizes under stringent conditions to the nucleotide sequence selected from the group consisting of SEQ ID NO: 2n-1, wherein n is an integer between 1 and 46, or a complement of the nucleotide sequence. In one embodiment, the invention provides a nucleic acid molecule wherein the nucleic acid includes the nucleotide sequence of a naturally occurring allelic nucleic acid variant.

Also included in the invention is a vector containing one or more of the nucleic acids described herein, and a cell containing the vectors or nucleic acids described herein. The invention is also directed to host cells transformed with a vector comprising any of the nucleic acid molecules described above.

In yet another aspect, the invention provides for a method for determining the presence or amount of a nucleic acid molecule in a sample by contacting a sample with a probe that binds a NOVX nucleic acid and determining the amount of the probe that is bound to the NOVX nucleic acid. For example the NOVX nucleic may be a marker for cell or tissue type such as a cell or tissue type that is cancerous.

In yet a further aspect, the invention provides a method for determining the presence of or predisposition to a disease associated with altered levels of a nucleic acid molecule in a first mammalian subject, wherein an alteration in the level of the nucleic acid in the first

4

subject as compared to the control sample indicates the presence of or predisposition to the disease.

The invention further provides an antibody that binds immunospecifically to a NOVX polypeptide. The NOVX antibody may be monoclonal, humanized, or a fully human

5   antibody. Preferably, the antibody has a dissociation constant for the binding of the NOVX polypeptide to the antibody less than 1×10^{-9} M. More preferably, the NOVX antibody neutralizes the activity of the NOVX polypeptide.

In a further aspect, the invention provides for the use of a therapeutic in the manufacture of a medicament for treating a syndrome associated with a human disease,

10   associated with a NOVX polypeptide. Preferably the therapeutic is a NOVX antibody.

In yet a further aspect, the invention provides a method of treating or preventing a NOVX-associated disorder, a method of treating a pathological state in a mammal, and a method of treating or preventing a pathology associated with a polypeptide by administering a NOVX antibody to a subject in an amount sufficient to treat or prevent the disorder.

15   Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. Although methods and materials similar or equivalent to those described herein can be used in the practice or testing of the present invention, suitable methods and materials are described below. All publications, patent applications, patents, and other references

20   mentioned herein are incorporated by reference in their entirety. In the case of conflict, the present specification, including definitions, will control. In addition, the materials, methods, and examples are illustrative only and are not intended to be limiting.

Other features and advantages of the invention will be apparent from the following detailed description and claims.

25

DETAILED DESCRIPTION OF THE INVENTION

The present invention provides novel nucleotides and polypeptides encoded thereby. Included in the invention are the novel nucleic acid sequences, their encoded polypeptides, antibodies, and other related compunds. The sequences are collectively referred to herein as

30   "NOVX nucleic acids" or "NOVX polynucleotides" and the corresponding encoded polypeptides are referred to as "NOVX polypeptides" or "NOVX proteins." Unless indicated otherwise, "NOVX" is meant to refer to any of the novel sequences disclosed herein. Table 1 provides a summary of the NOVX nucleic acids and their encoded polypeptides.

Table 1 indicates the homology of NOVX polypeptides to known protein families. Thus, the nucleic acids and polypeptides, antibodies and related compounds according to the invention corresponding to a NOVX as identified in column 1 of Table 1 will be useful in

5   therapeutic and diagnostic applications implicated in, for example, pathologies and disorders associated with the known protein families identified in column 5 of Table 1.

NOVX nucleic acids and their encoded polypeptides are useful in a variety of applications and contexts. The various NOVX nucleic acids and polypeptides according to the invention are useful as novel members of the protein families according to the presence of

10   domains and sequence relatedness to previously described proteins. Additionally, NOVX nucleic acids and polypeptides can also be used to identify proteins that are members of the family to which the NOVX polypeptides belong.

Consistent with other known members of the family of proteins, identified in column 5 of Table 1, the NOVX polypeptides of the present invention show homology to, and

15   contain domains that are characteristic of, other members of such protein families. Details of the sequence relatedness and domain analysis for each NOVX are presented in Example A.

The NOVX nucleic acids and polypeptides can also be used to screen for molecules, which inhibit or enhance NOVX activity or function. Specifically, the nucleic acids and polypeptides according to the invention may be used as targets for the identification of small

20   molecules that modulate or inhibit diseases associated with the protein families listed in Table 1.

The NOVX nucleic acids and polypeptides are also useful for detecting specific cell types. Details of the expression analysis for each NOVX are presented in Example B. Accordingly, the NOVX nucleic acids, polypeptides, antibodies and related compounds

25   according to the invention will have diagnostic and therapeutic applications in the detection of a variety of diseases with differential expression in normal vs. diseased tissues, e.g. detection of a variety of cancers.

Additional utilities for NOVX nucleic acids and polypeptides according to the invention are disclosed herein.

7

NOVX clones

NOVX nucleic acids and their encoded polypeptides are useful in a variety of applications and contexts. The various NOVX nucleic acids and polypeptides according to the invention are useful as novel members of the protein families according to the presence of domains and sequence relatedness to previously described proteins. Additionally, NOVX nucleic acids and polypeptides can also be used to identify proteins that are members of the family to which the NOVX polypeptides belong.

The NOVX genes and their corresponding encoded proteins are useful for preventing, treating or ameliorating medical conditions, *e.g.*, by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the NOVX genes, based on the tissues in which they are most highly expressed. Uses include developing products for the diagnosis or treatment of a variety of diseases and disorders.

The NOVX nucleic acids and proteins of the invention are useful in potential diagnostic and therapeutic applications and as research tools. These include serving as a specific or selective nucleic acid or protein diagnostic and/or prognostic marker, wherein the presence or amount of the nucleic acid or the protein are to be assessed, as well as potential therapeutic applications such as the following: (i) a protein therapeutic, (ii) a small molecule drug target, (iii) an antibody target (therapeutic, diagnostic, drug targeting/cytotoxic antibody), (iv) a nucleic acid useful in gene therapy (gene delivery/gene ablation), and (v) a composition promoting tissue regeneration *in vitro* and *in vivo* (vi) a biological defense weapon.

In one specific embodiment, the invention includes an isolated polypeptide comprising an amino acid sequence selected from the group consisting of: (a) a mature form of the amino acid sequence selected from the group consisting of SEQ ID NO: 2n, wherein n is an integer between 1 and 46; (b) a variant of a mature form of the amino acid sequence selected from the group consisting of SEQ ID NO: 2n, wherein n is an integer between 1 and 46, wherein any amino acid in the mature form is changed to a different amino acid, provided that no more than 15% of the amino acid residues in the sequence of the mature form are so changed; (c) an amino acid sequence selected from the group consisting of SEQ ID NO: 2n, wherein n is an integer between 1 and 46; (d) a variant of the amino acid sequence selected from the group consisting of SEQ ID NO:2n, wherein n is an integer between 1 and 46

8

wherein any amino acid specified in the chosen sequence is changed to a different amino acid, provided that no more than 15% of the amino acid residues in the sequence are so changed; and (e) a fragment of any of (a) through (d).

In another specific embodiment, the invention includes an isolated nucleic acid molecule comprising a nucleic acid sequence encoding a polypeptide comprising an amino acid sequence selected from the group consisting of: (a) a mature form of the amino acid sequence given SEQ ID NO: 2n, wherein n is an integer between 1 and 46; (b) a variant of a mature form of the amino acid sequence selected from the group consisting of SEQ ID NO: 2n, wherein n is an integer between 1 and 46 wherein any amino acid in the mature form of the chosen sequence is changed to a different amino acid, provided that no more than 15% of the amino acid residues in the sequence of the mature form are so changed; (c) the amino acid sequence selected from the group consisting of SEQ ID NO: 2n, wherein n is an integer between 1 and 46; (d) a variant of the amino acid sequence selected from the group consisting of SEQ ID NO: 2n, wherein n is an integer between 1 and 46, in which any amino acid specified in the chosen sequence is changed to a different amino acid, provided that no more than 15% of the amino acid residues in the sequence are so changed; (e) a nucleic acid fragment encoding at least a portion of a polypeptide comprising the amino acid sequence selected from the group consisting of SEQ ID NO: 2n, wherein n is an integer between 1 and 46 or any variant of said polypeptide wherein any amino acid of the chosen sequence is changed to a different amino acid, provided that no more than 10% of the amino acid residues in the sequence are so changed; and (f) the complement of any of said nucleic acid molecules.

In yet another specific embodiment, the invention includes an isolated nucleic acid molecule, wherein said nucleic acid molecule comprises a nucleotide sequence selected from the group consisting of: (a) the nucleotide sequence selected from the group consisting of SEQ ID NO: 2n-1, wherein n is an integer between 1 and 46; (b) a nucleotide sequence wherein one or more nucleotides in the nucleotide sequence selected from the group consisting of SEQ ID NO: 2n-1, wherein n is an integer between 1 and 46 is changed from that selected from the group consisting of the chosen sequence to a different nucleotide provided that no more than 15% of the nucleotides are so changed; (c) a nucleic acid fragment of the sequence selected from the group consisting of SEQ ID NO: 2n-1, wherein n is an integer between 1 and 46; and (d) a nucleic acid fragment wherein one or more nucleotides in the nucleotide sequence selected from the group consisting of SEQ ID NO: 2n-1, wherein n is an integer between 1 and 101 is changed from that selected from the

9

group consisting of the chosen sequence to a different nucleotide provided that no more than
15% of the nucleotides are so changed.

NOVX Nucleic Acids and Polypeptides

One aspect of the invention pertains to isolated nucleic acid molecules that encode
5   NOVX polypeptides or biologically active portions thereof. Also included in the invention
are nucleic acid fragments sufficient for use as hybridization probes to identify NOVX-
encoding nucleic acids (e.g., NOVX mRNA's) and fragments for use as PCR primers for the
amplification and/or mutation of NOVX nucleic acid molecules. As used herein, the term
"nucleic acid molecule" is intended to include DNA molecules (e.g., cDNA or genomic
10   DNA), RNA molecules (e.g., mRNA), analogs of the DNA or RNA generated using
nucleotide analogs, and derivatives, fragments and homologs thereof. The nucleic acid
molecule may be single-stranded or double-stranded, but preferably is comprised double-
stranded DNA.

A NOVX nucleic acid can encode a mature NOVX polypeptide. As used herein, a
15   "mature" form of a polypeptide or protein disclosed in the present invention is the product of
a naturally occurring polypeptide or precursor form or proprotein. The naturally occurring
polypeptide, precursor or proprotein includes, by way of nonlimiting example, the full-length
gene product encoded by the corresponding gene. Alternatively, it may be defined as the
polypeptide, precursor or proprotein encoded by an ORF described herein. The product
20   "mature" form arises, again by way of nonlimiting example, as a result of one or more
naturally occurring processing steps as they may take place within the cell, or host cell, in
which the gene product arises. Examples of such processing steps leading to a "mature" form
of a polypeptide or protein include the cleavage of the N-terminal methionine residue
encoded by the initiation codon of an ORF, or the proteolytic cleavage of a signal peptide or
25   leader sequence. Thus a mature form arising from a precursor polypeptide or protein that has
residues 1 to N, where residue 1 is the N-terminal methionine, would have residues 2 through
N remaining after removal of the N-terminal methionine. Alternatively, a mature form
arising from a precursor polypeptide or protein having residues 1 to N, in which an N-
terminal signal sequence from residue 1 to residue M is cleaved, would have the residues
30   from residue M+1 to residue N remaining. Further as used herein, a "mature" form of a
polypeptide or protein may arise from a step of post-translational modification other than a
proteolytic cleavage event. Such additional processes include, by way of non-limiting
example, glycosylation, myristylation or phosphorylation. In general, a mature polypeptide

10

or protein may result from the operation of only one of these processes, or a combination of any of them.

The term "probes", as utilized herein, refers to nucleic acid sequences of variable length, preferably between at least about 10 nucleotides (nt), 100 nt, or as many as

5   approximately, *e.g.*, 6,000 nt, depending upon the specific use. Probes are used in the detection of identical, similar, or complementary nucleic acid sequences. Longer length probes are generally obtained from a natural or recombinant source, are highly specific, and much slower to hybridize than shorter-length oligomer probes. Probes may be single- or double-stranded and designed to have specificity in PCR, membrane-based hybridization

10   technologies, or ELISA-like technologies.

The term "isolated" nucleic acid molecule, as utilized herein, is one, which is separated from other nucleic acid molecules which are present in the natural source of the nucleic acid. Preferably, an "isolated" nucleic acid is free of sequences which naturally flank the nucleic acid (*i.e.*, sequences located at the 5'- and 3'-termini of the nucleic acid) in the

15   genomic DNA of the organism from which the nucleic acid is derived. For example, in various embodiments, the isolated NOVX nucleic acid molecules can contain less than about 5 kb, 4 kb, 3 kb, 2 kb, 1 kb, 0.5 kb or 0.1 kb of nucleotide sequences which naturally flank the nucleic acid molecule in genomic DNA of the cell/tissue from which the nucleic acid is derived (*e.g.*, brain, heart, liver, spleen, *etc.*). Moreover, an "isolated" nucleic acid molecule,

20   such as a cDNA molecule, can be substantially free of other cellular material or culture medium when produced by recombinant techniques, or of chemical precursors or other chemicals when chemically synthesized.

A nucleic acid molecule of the invention, *e.g.*, a nucleic acid molecule having the nucleotide sequence of SEQ ID NO:2*n*-1, wherein *n* is an integer between 1-46, or a

25   complement of this aforementioned nucleotide sequence, can be isolated using standard molecular biology techniques and the sequence information provided herein. Using all or a portion of the nucleic acid sequence of SEQ ID NO:2*n*-1, wherein *n* is an integer between 1-46, as a hybridization probe, NOVX molecules can be isolated using standard hybridization and cloning techniques (*e.g.*, as described in Sambrook, *et al.*, (eds.), MOLECULAR CLONING:

30   A LABORATORY MANUAL 2nd Ed., Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, 1989; and Ausubel, *et al.*, (eds.), CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, John Wiley & Sons, New York, NY, 1993.)

A nucleic acid of the invention can be amplified using cDNA, mRNA or alternatively, genomic DNA, as a template and appropriate oligonucleotide primers according to standard

11

PCR amplification techniques. The nucleic acid so amplified can be cloned into an appropriate vector and characterized by DNA sequence analysis. Furthermore, oligonucleotides corresponding to NOVX nucleotide sequences can be prepared by standard synthetic techniques, *e.g.*, using an automated DNA synthesizer.

5   As used herein, the term "oligonucleotide" refers to a series of linked nucleotide residues, which oligonucleotide has a sufficient number of nucleotide bases to be used in a PCR reaction. A short oligonucleotide sequence may be based on, or designed from, a genomic or cDNA sequence and is used to amplify, confirm, or reveal the presence of an identical, similar or complementary DNA or RNA in a particular cell or tissue.

10   Oligonucleotides comprise portions of a nucleic acid sequence having about 10 nt, 50 nt, or 100 nt in length, preferably about 15 nt to 30 nt in length. In one embodiment of the invention, an oligonucleotide comprising a nucleic acid molecule less than 100 nt in length would further comprise at least 6 contiguous nucleotides of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, or a complement thereof. Oligonucleotides may be chemically

15   synthesized and may also be used as probes.

        In another embodiment, an isolated nucleic acid molecule of the invention comprises a nucleic acid molecule that is a complement of the nucleotide sequence SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, or a portion of this nucleotide sequence (*e.g.*, a fragment that can be used as a probe or primer or a fragment encoding a biologically-active

20   portion of a NOVX polypeptide). A nucleic acid molecule that is complementary to the nucleotide sequence of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, is one that is sufficiently complementary to the nucleotide sequence of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, that it can hydrogen bond with little or no mismatches to the nucleotide sequence of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, thereby forming a stable

25   duplex.

        As used herein, the term "complementary" refers to Watson-Crick or Hoogsteen base pairing between nucleotides units of a nucleic acid molecule, and the term "binding" means the physical or chemical interaction between two polypeptides or compounds or associated polypeptides or compounds or combinations thereof. Binding includes ionic, non-ionic, van

30   der Waals, hydrophobic interactions, and the like. A physical interaction can be either direct or indirect. Indirect interactions may be through or due to the effects of another polypeptide or compound. Direct binding refers to interactions that do not take place through, or due to, the effect of another polypeptide or compound, but instead are without other substantial chemical intermediates.

12

Fragments provided herein are defined as sequences of at least 6 (contiguous) nucleic acids or at least 4 (contiguous) amino acids, a length sufficient to allow for specific hybridization in the case of nucleic acids or for specific recognition of an epitope in the case of amino acids, respectively, and are at most some portion less than a full length sequence.

5   Fragments may be derived from any contiguous portion of a nucleic acid or amino acid sequence of choice. Derivatives are nucleic acid sequences or amino acid sequences formed from the native compounds either directly or by modification or partial substitution. Analogs are nucleic acid sequences or amino acid sequences that have a structure similar to, but not identical to, the native compound but differs from it in respect to certain components or side

10   chains. Analogs may be synthetic or from a different evolutionary origin and may have a similar or opposite metabolic activity compared to wild type. Homologs are nucleic acid sequences or amino acid sequences of a particular gene that are derived from different species.

A full-length NOVX clone is identified as containing an ATG translation start codon

15   and an in-frame stop codon. Any disclosed NOVX nucleotide sequence lacking an ATG start codon therefore encodes a truncated C-terminal fragment of the respective NOVX polypeptide, and requires that the corresponding full-length cDNA extend in the 5' direction of the disclosed sequence. Any disclosed NOVX nucleotide sequence lacking an in-frame stop codon similarly encodes a truncated N-terminal fragment of the respective NOVX

20   polypeptide, and requires that the corresponding full-length cDNA extend in the 3' direction of the disclosed sequence.

Derivatives and analogs may be full length or other than full length, if the derivative or analog contains a modified nucleic acid or amino acid, as described below. Derivatives or analogs of the nucleic acids or proteins of the invention include, but are not limited to,

25   molecules comprising regions that are substantially homologous to the nucleic acids or proteins of the invention, in various embodiments, by at least about 70%, 80%, or 95% identity (with a preferred identity of 80-95%) over a nucleic acid or amino acid sequence of identical size or when compared to an aligned sequence in which the alignment is done by a computer homology program known in the art, or whose encoding nucleic acid is capable of

30   hybridizing to the complement of a sequence encoding the aforementioned proteins under stringent, moderately stringent, or low stringent conditions. *See e.g.* Ausubel, *et al.*, CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, John Wiley & Sons, New York, NY, 1993, and below.

13

A "homologous nucleic acid sequence" or "homologous amino acid sequence," or variations thereof, refer to sequences characterized by a homology at the nucleotide level or amino acid level as discussed above. Homologous nucleotide sequences encode those sequences coding for isoforms of NOVX polypeptides. Isoforms can be expressed in

5   different tissues of the same organism as a result of, for example, alternative splicing of RNA. Alternatively, isoforms can be encoded by different genes. In the invention, homologous nucleotide sequences include nucleotide sequences encoding for a NOVX polypeptide of species other than humans, including, but not limited to: vertebrates, and thus can include, e.g., frog, mouse, rat, rabbit, dog, cat cow, horse, and other organisms.

10   Homologous nucleotide sequences also include, but are not limited to, naturally occurring allelic variations and mutations of the nucleotide sequences set forth herein. A homologous nucleotide sequence does not, however, include the exact nucleotide sequence encoding human NOVX protein. Homologous nucleic acid sequences include those nucleic acid sequences that encode conservative amino acid substitutions (see below) in SEQ ID NO:2n-1,

15   wherein n is an integer between 1-46, as well as a polypeptide possessing NOVX biological activity. Various biological activities of the NOVX proteins are described below.

A NOVX polypeptide is encoded by the open reading frame ("ORF") of a NOVX nucleic acid. An ORF corresponds to a nucleotide sequence that could potentially be translated into a polypeptide. A stretch of nucleic acids comprising an ORF is uninterrupted

20   by a stop codon. An ORF that represents the coding sequence for a full protein begins with an ATG "start" codon and terminates with one of the three "stop" codons, namely, TAA, TAG, or TGA. For the purposes of this invention, an ORF may be any part of a coding sequence, with or without a start codon, a stop codon, or both. For an ORF to be considered as a good candidate for coding for a bona fide cellular protein, a minimum size requirement is

25   often set, e.g., a stretch of DNA that would encode a protein of 50 amino acids or more.

The nucleotide sequences determined from the cloning of the human NOVX genes allows for the generation of probes and primers designed for use in identifying and/or cloning NOVX homologues in other cell types, e.g. from other tissues, as well as NOVX homologues from other vertebrates. The probe/primer typically comprises substantially purified

30   oligonucleotide. The oligonucleotide typically comprises a region of nucleotide sequence that hybridizes under stringent conditions to at least about 12, 25, 50, 100, 150, 200, 250, 300, 350 or 400 consecutive sense strand nucleotide sequence of SEQ ID NO:2n-1, wherein n is an integer between 1-46; or an anti-sense strand nucleotide sequence of SEQ ID NO:2n-1;

wherein n is an integer between 1-46; or of a naturally occurring mutant of SEQ ID NO:2n-1, wherein n is an integer between 1-46.

Probes based on the human NOVX nucleotide sequences can be used to detect transcripts or genomic sequences encoding the same or homologous proteins. In various embodiments, the probe further comprises a label group attached thereto, *e.g.* the label group can be a radioisotope, a fluorescent compound, an enzyme, or an enzyme co-factor. Such probes can be used as a part of a diagnostic test kit for identifying cells or tissues which mis-express a NOVX protein, such as by measuring a level of a NOVX-encoding nucleic acid in a sample of cells from a subject *e.g.*, detecting NOVX mRNA levels or determining whether a genomic NOVX gene has been mutated or deleted.

"A polypeptide having a biologically-active portion of a NOVX polypeptide" refers to polypeptides exhibiting activity similar, but not necessarily identical to, an activity of a polypeptide of the invention, including mature forms, as measured in a particular biological assay, with or without dose dependency. A nucleic acid fragment encoding a "biologically-active portion of NOVX" can be prepared by isolating a portion of SEQ ID NO:2n-1, wherein n is an integer between 1-46, that encodes a polypeptide having a NOVX biological activity (the biological activities of the NOVX proteins are described below), expressing the encoded portion of NOVX protein (*e.g.*, by recombinant expression *in vitro*) and assessing the activity of the encoded portion of NOVX.

NOVX Nucleic Acid and Polypeptide Variants

The invention further encompasses nucleic acid molecules that differ from the nucleotide sequences of SEQ ID NO:2n-1, wherein n is an integer between 1-46, due to degeneracy of the genetic code and thus encode the same NOVX proteins as that encoded by the nucleotide sequences of SEQ ID NO:2n-1, wherein n is an integer between 1-46. In another embodiment, an isolated nucleic acid molecule of the invention has a nucleotide sequence encoding a protein having an amino acid sequence of SEQ ID NO:2n, wherein n is an integer between 1-46.

In addition to the human NOVX nucleotide sequences of SEQ ID NO:2n-1, wherein n is an integer between 1-46, it will be appreciated by those skilled in the art that DNA sequence polymorphisms that lead to changes in the amino acid sequences of the NOVX polypeptides may exist within a population (*e.g.*, the human population). Such genetic polymorphism in the NOVX genes may exist among individuals within a population due to natural allelic variation. As used herein, the terms "gene" and "recombinant gene" refer to

15

nucleic acid molecules comprising an open reading frame (ORF) encoding a NOVX protein, preferably a vertebrate NOVX protein. Such natural allelic variations can typically result in 1-5% variance in the nucleotide sequence of the NOVX genes. Any and all such nucleotide variations and resulting amino acid polymorphisms in the NOVX polypeptides, which are the

5   result of natural allelic variation and that do not alter the functional activity of the NOVX polypeptides, are intended to be within the scope of the invention.

Moreover, nucleic acid molecules encoding NOVX proteins from other species, and thus that have a nucleotide sequence that differs from any one of the human SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, are intended to be within the scope of the invention.

10   Nucleic acid molecules corresponding to natural allelic variants and homologues of the NOVX cDNAs of the invention can be isolated based on their homology to the human NOVX nucleic acids disclosed herein using the human cDNAs, or a portion thereof, as a hybridization probe according to standard hybridization techniques under stringent hybridization conditions.

15   Accordingly, in another embodiment, an isolated nucleic acid molecule of the invention is at least 6 nucleotides in length and hybridizes under stringent conditions to the nucleic acid molecule comprising the nucleotide sequence of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46. In another embodiment, the nucleic acid is at least 10, 25, 50, 100, 250, 500, 750, 1000, 1500, or 2000 or more nucleotides in length. In yet another

20   embodiment, an isolated nucleic acid molecule of the invention hybridizes to the coding region. As used herein, the term "hybridizes under stringent conditions" is intended to describe conditions for hybridization and washing under which nucleotide sequences at least 60% homologous to each other typically remain hybridized to each other.

Homologs (*i.e.*, nucleic acids encoding NOVX proteins derived from species other

25   than human) or other related sequences (*e.g.*, paralogs) can be obtained by low, moderate or high stringency hybridization with all or a portion of the particular human sequence as a probe using methods well known in the art for nucleic acid hybridization and cloning.

As used herein, the phrase "stringent hybridization conditions" refers to conditions under which a probe, primer or oligonucleotide will hybridize to its target sequence, but to no

30   other sequences. Stringent conditions are sequence-dependent and will be different in different circumstances. Longer sequences hybridize specifically at higher temperatures than shorter sequences. Generally, stringent conditions are selected to be about 5 °C lower than the thermal melting point (Tm) for the specific sequence at a defined ionic strength and pH. The Tm is the temperature (under defined ionic strength, pH and nucleic acid concentration) at

16

which 50% of the probes complementary to the target sequence hybridize to the target sequence at equilibrium. Since the target sequences are generally present at excess, at Tm, 50% of the probes are occupied at equilibrium. Typically, stringent conditions will be those in which the salt concentration is less than about 1.0 M sodium ion, typically about 0.01 to 5 1.0 M sodium ion (or other salts) at pH 7.0 to 8.3 and the temperature is at least about 30 °C for short probes, primers or oligonucleotides (*e.g.*, 10 nt to 50 nt) and at least about 60 °C for longer probes, primers and oligonucleotides. Stringent conditions may also be achieved with the addition of destabilizing agents, such as formamide.

Stringent conditions are known to those skilled in the art and can be found in Ausubel, 10 *et al.*, (eds.), CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, John Wiley & Sons, N.Y. (1989), 6.3.1-6.3.6. Preferably, the conditions are such that sequences at least about 65%, 70%, 75%, 85%, 90%, 95%, 98%, or 99% homologous to each other typically remain hybridized to each other. A non-limiting example of stringent hybridization conditions are hybridization in a high salt buffer comprising 6X SSC, 50 mM Tris-HCl (pH 7.5), 1 mM 15 EDTA, 0.02% PVP, 0.02% Ficoll, 0.02% BSA, and 500 mg/ml denatured salmon sperm DNA at 65 °C, followed by one or more washes in 0.2X SSC, 0.01% BSA at 50 °C. An isolated nucleic acid molecule of the invention that hybridizes under stringent conditions to any one of the sequences of SEQ ID NO:2n-1, wherein n is an integer between 1-46, corresponds to a naturally-occurring nucleic acid molecule. As used herein, a 20 "naturally-occurring" nucleic acid molecule refers to an RNA or DNA molecule having a nucleotide sequence that occurs in nature (*e.g.*, encodes a natural protein).

In a second embodiment, a nucleic acid sequence that is hybridizable to the nucleic acid molecule comprising the nucleotide sequence of SEQ ID NO:2n-1, wherein n is an integer between 1-46, or fragments, analogs or derivatives thereof, under conditions of 25 moderate stringency is provided. A non-limiting example of moderate stringency hybridization conditions are hybridization in 6X SSC, 5X Reinhardt's solution, 0.5% SDS and 100 mg/ml denatured salmon sperm DNA at 55 °C, followed by one or more washes in 1X SSC, 0.1% SDS at 37 °C. Other conditions of moderate stringency that may be used are well-known within the art. *See, e.g.*, Ausubel, et *al.* (eds.), 1993, CURRENT PROTOCOLS IN 30 MOLECULAR BIOLOGY, John Wiley & Sons, NY, and Krieger, 1990; GENE TRANSFER AND EXPRESSION, A LABORATORY MANUAL, Stockton Press, NY.

In a third embodiment, a nucleic acid that is hybridizable to the nucleic acid molecule comprising the nucleotide sequences of SEQ ID NO:2n-1, wherein n is an integer between 1-46, or fragments, analogs or derivatives thereof, under conditions of low stringency, is

17

provided. A non-limiting example of low stringency hybridization conditions are hybridization in 35% formamide, 5X SSC, 50 mM Tris-HCl (pH 7.5), 5 mM EDTA, 0.02% PVP, 0.02% Ficoll, 0.2% BSA, 100 mg/ml denatured salmon sperm DNA, 10% (wt/volt) dextran sulfate at 40 °C, followed by one or more washes in 2X SSC, 25 mM Tris-HCl (pH

5   7.4), 5 mM EDTA, and 0.1% SDS at 50 °C. Other conditions of low stringency that may be used are well known in the art (*e.g.*, as employed for cross-species hybridizations). *See, e.g.*, Ausubel, *et al.* (eds.), 1993, CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, John Wiley & Sons, NY, and Kriegler, 1990, GENE TRANSFER AND EXPRESSION, A LABORATORY MANUAL, Stockton Press, NY; Shilo and Weinberg, 1981. *Proc Natl Acad Sci USA* 78: 6789-6792.

10

Conservative Mutations

In addition to naturally-occurring allelic variants of NOVX sequences that may exist in the population, the skilled artisan will further appreciate that changes can be introduced by mutation into the nucleotide sequences of SEQ ID NO:2*n*-1, wherein *n* is an integer between

15   1-46, thereby leading to changes in the amino acid sequences of the encoded NOVX proteins, without altering the functional ability of said NOVX proteins. For example, nucleotide substitutions leading to amino acid substitutions at "non-essential" amino acid residues can be made in the sequence of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46. A "non-essential" amino acid residue is a residue that can be altered from the wild-type

20   sequences of the NOVX proteins without altering their biological activity, whereas an "essential" amino acid residue is required for such biological activity. For example, amino acid residues that are conserved among the NOVX proteins of the invention are particularly non-amenable to alteration. Amino acids for which conservative substitutions can be made are well-known within the art.

25   Another aspect of the invention pertains to nucleic acid molecules encoding NOVX proteins that contain changes in amino acid residues that are not essential for activity. Such NOVX proteins differ in amino acid sequence from any one of SEQ ID NO:2*n*-1, wherein *n* is an integer between 1-46, yet retain biological activity. In one embodiment, the isolated nucleic acid molecule comprises a nucleotide sequence encoding a protein, wherein the

30   protein comprises an amino acid sequence at least about 45% homologous to the amino acid sequences of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46. Preferably, the protein encoded by the nucleic acid molecule is at least about 60% homologous to SEQ ID NO:2*n*, wherein *n* is an integer between 1-46; more preferably at least about 70% homologous to SEQ ID NO:2*n*, wherein *n* is an integer between 1-46; still more preferably at least about

80% homologous to SEQ ID NO:2n, wherein n is an integer between 1-46; even more preferably at least about 90% homologous to SEQ ID NO:2n, wherein n is an integer between 1-46; and most preferably at least about 95% homologous to SEQ ID NO:2n, wherein n is an integer between 1-46.

5   An isolated nucleic acid molecule encoding a NOVX protein homologous to the protein of SEQ ID NO:2n, wherein n is an integer between 1-46, can be created by introducing one or more nucleotide substitutions, additions or deletions into the nucleotide sequence of SEQ ID NO:2n-1, wherein n is an integer between 1-46, such that one or more amino acid substitutions, additions or deletions are introduced into the encoded protein.

10   Mutations can be introduced into any of SEQ ID NO:2n-1, wherein n is an integer between 1-46, by standard techniques, such as site-directed mutagenesis and PCR-mediated mutagenesis. Preferably, conservative amino acid substitutions are made at one or more predicted, non-essential amino acid residues. A "conservative amino acid substitution" is one in which the amino acid residue is replaced with an amino acid residue having a similar side

15   chain. Families of amino acid residues having similar side chains have been defined within the art. These families include amino acids with basic side chains (e.g., lysine, arginine, histidine), acidic side chains (e.g., aspartic acid, glutamic acid), uncharged polar side chains (e.g., glycine, asparagine, glutamine, serine, threonine, tyrosine, cysteine), nonpolar side chains (e.g., alanine, valine, leucine, isoleucine, proline, phenylalanine, methionine,

20   tryptophan), beta-branched side chains (e.g., threonine, valine, isoleucine) and aromatic side chains (e.g., tyrosine, phenylalanine, tryptophan, histidine). Thus, a predicted non-essential amino acid residue in the NOVX protein is replaced with another amino acid residue from the same side chain family. Alternatively, in another embodiment, mutations can be introduced randomly along all or part of a NOVX coding sequence, such as by saturation mutagenesis,

25   and the resultant mutants can be screened for NOVX biological activity to identify mutants that retain activity. Following mutagenesis of any one of SEQ ID NO:2n-1, wherein n is an integer between 1-46, the encoded protein can be expressed by any recombinant technology known in the art and the activity of the protein can be determined.

The relatedness of amino acid families may also be determined based on side chain

30   interactions. Substituted amino acids may be fully conserved "strong" residues or fully conserved "weak" residues. The "strong" group of conserved amino acid residues may be any one of the following groups: STA, NEQK, NHQK, NDEQ, QHRK, MILV, MILF, HY, FYW, wherein the single letter amino acid codes are grouped by those amino acids that may be substituted for each other. Likewise, the "weak" group of conserved residues may be any

19

one of the following: CSA, ATV, SAG, STNK, STPA, SGND, SNDEQK, NDEQHK, NEQHRK, HFY, wherein the letters within each group represent the single letter amino acid code.

In one embodiment, a mutant NOVX protein can be assayed for (*i*) the ability to form protein:protein interactions with other NOVX proteins, other cell-surface proteins, or biologically-active portions thereof, (*ii*) complex formation between a mutant NOVX protein and a NOVX ligand; or (*iii*) the ability of a mutant NOVX protein to bind to an intracellular target protein or biologically-active portion thereof; (*e.g.* avidin proteins).

In yet another embodiment, a mutant NOVX protein can be assayed for the ability to regulate a specific biological function (*e.g.*, regulation of insulin release).

Antisense Nucleic Acids

Another aspect of the invention pertains to isolated antisense nucleic acid molecules that are hybridizable to or complementary to the nucleic acid molecule comprising the nucleotide sequence of SEQ ID NO:2n-1, wherein n is an integer between 1-46, or fragments, analogs or derivatives thereof. An "antisense" nucleic acid comprises a nucleotide sequence that is complementary to a "sense" nucleic acid encoding a protein (*e.g.*, complementary to the coding strand of a double-stranded cDNA molecule or complementary to an mRNA sequence). In specific aspects, antisense nucleic acid molecules are provided that comprise a sequence complementary to at least about 10, 25, 50, 100, 250 or 500 nucleotides or an entire NOVX coding strand, or to only a portion thereof. Nucleic acid molecules encoding fragments, homologs, derivatives and analogs of a NOVX protein of SEQ ID NO:2n, wherein n is an integer between 1-46, or antisense nucleic acids complementary to a NOVX nucleic acid sequence of SEQ ID NO:2n-1, wherein n is an integer between 1-46, are additionally provided.

In one embodiment, an antisense nucleic acid molecule is antisense to a "coding region" of the coding strand of a nucleotide sequence encoding a NOVX protein. The term "coding region" refers to the region of the nucleotide sequence comprising codons which are translated into amino acid residues. In another embodiment, the antisense nucleic acid molecule is antisense to a "noncoding region" of the coding strand of a nucleotide sequence encoding the NOVX protein. The term "noncoding region" refers to 5' and 3' sequences which flank the coding region that are not translated into amino acids (*i.e.*, also referred to as 5' and 3' untranslated regions).

20

Given the coding strand sequences encoding the NOVX protein disclosed herein, antisense nucleic acids of the invention can be designed according to the rules of Watson and Crick or Hoogsteen base pairing. The antisense nucleic acid molecule can be complementary to the entire coding region of NOVX mRNA, but more preferably is an oligonucleotide that is

5   antisense to only a portion of the coding or noncoding region of NOVX mRNA. For example, the antisense oligonucleotide can be complementary to the region surrounding the translation start site of NOVX mRNA. An antisense oligonucleotide can be, for example, about 5, 10, 15, 20, 25, 30, 35, 40, 45 or 50 nucleotides in length. An antisense nucleic acid of the invention can be constructed using chemical synthesis or enzymatic ligation reactions

10   using procedures known in the art. For example, an antisense nucleic acid (*e.g.*, an antisense oligonucleotide) can be chemically synthesized using naturally-occurring nucleotides or variously modified nucleotides designed to increase the biological stability of the molecules or to increase the physical stability of the duplex formed between the antisense and sense nucleic acids (*e.g.*, phosphorothioate derivatives and acridine substituted nucleotides can be

15   used).

Examples of modified nucleotides that can be used to generate the antisense nucleic acid include: 5-fluorouracil, 5-bromouracil, 5-chlorouracil, 5-iodouracil, hypoxanthine, xanthine, 4-acetylcytosine, 5-(carboxyhydroxylmethyl) uracil, 5-carboxymethylaminomethyl-2-thiouridine, 5-carboxymethylaminomethyluracil, dihydrouracil, beta-D-galactosylqueosine,

20   inosine, N6-isopentenyladenine, 1-methylguanine, 1-methylinosine, 2,2-dimethylguanine, 2-methyladenine, 2-methylguanine, 3-methylcytosine, 5-methylcytosine, N6-adenine, 7-methylguanine, 5-methylaminomethyluracil, 5-methoxyaminomethyl-2-thiouracil, beta-D-mannosylqueosine, 5'-methoxycarboxymethyluracil, 5-methoxyuracil, 2-methylthio-N6-isopentenyladenine, uracil-5-oxyacetic acid (v), wybutoxosine,

25   pseudouracil, queosine, 2-thiocytosine, 5-methyl-2-thiouracil, 2-thiouracil, 4-thiouracil, 5-methyluracil, uracil-5-oxyacetic acid methylester, uracil-5-oxyacetic acid (v), 5-methyl-2-thiouracil, 3-(3-amino-3-N-2-carboxypropyl) uracil, (acp3)w, and 2,6-diaminopurine. Alternatively, the antisense nucleic acid can be produced biologically using an expression vector into which a nucleic acid has been subcloned in an antisense

30   orientation (*i.e.*, RNA transcribed from the inserted nucleic acid will be of an antisense orientation to a target nucleic acid of interest, described further in the following subsection).

The antisense nucleic acid molecules of the invention are typically administered to a subject or generated *in situ* such that they hybridize with or bind to cellular mRNA and/or genomic DNA encoding a NOVX protein to thereby inhibit expression of the protein (*e.g.*, by

21

inhibiting transcription and/or translation). The hybridization can be by conventional nucleotide complementarity to form a stable duplex, or, for example, in the case of an antisense nucleic acid molecule that binds to DNA duplexes, through specific interactions in the major groove of the double helix. An example of a route of administration of antisense

5   nucleic acid molecules of the invention includes direct injection at a tissue site. Alternatively, antisense nucleic acid molecules can be modified to target selected cells and then administered systemically. For example, for systemic administration, antisense molecules can be modified such that they specifically bind to receptors or antigens expressed on a selected cell surface (e.g., by linking the antisense nucleic acid molecules to peptides or

10   antibodies that bind to cell surface receptors or antigens). The antisense nucleic acid molecules can also be delivered to cells using the vectors described herein. To achieve sufficient nucleic acid molecules, vector constructs in which the antisense nucleic acid molecule is placed under the control of a strong pol II or pol III promoter are preferred.

In yet another embodiment, the antisense nucleic acid molecule of the invention is an

15   α-anomeric nucleic acid molecule. An α-anomeric nucleic acid molecule forms specific double-stranded hybrids with complementary RNA in which, contrary to the usual β-units, the strands run parallel to each other. See, e.g., Gaultier, et al., 1987. Nucl. Acids Res. 15: 6625-6641. The antisense nucleic acid molecule can also comprise a 2'-o-methylribonucleotide (See, e.g., Inoue, et al. 1987. Nucl. Acids Res. 15: 6131-6148) or a

20   chimeric RNA-DNA analogue (See, e.g., Inoue, et al., 1987. FEBS Lett. 215: 327-330.

Ribozymes and PNA Moieties

Nucleic acid modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These

25   modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.

In one embodiment, an antisense nucleic acid of the invention is a ribozyme. Ribozymes are catalytic RNA molecules with ribonuclease activity that are capable of

30   cleaving a single-stranded nucleic acid, such as an mRNA, to which they have a complementary region. Thus, ribozymes (e.g., hammerhead ribozymes as described in Haselhoff and Gerlach 1988. Nature 334: 585-591) can be used to catalytically cleave NOVX mRNA transcripts to thereby inhibit translation of NOVX mRNA. A ribozyme having

22

specificity for a NOVX-encoding nucleic acid can be designed based upon the nucleotide sequence of a NOVX cDNA disclosed herein (*i.e.*, any one of SEQ ID NO:2*n*-1, wherein *n* is an integer between 1-46). For example, a derivative of a *Tetrahymena* L-19 IVS RNA can be constructed in which the nucleotide sequence of the active site is complementary to the

5 nucleotide sequence to be cleaved in a NOVX-encoding mRNA. *See, e.g.*, U.S. Patent 4,987,071 to Cech, *et al.* and U.S. Patent 5,116,742 to Cech, *et al.* NOVX mRNA can also be used to select a catalytic RNA having a specific ribonuclease activity from a pool of RNA molecules. *See, e.g.*, Bartel *et al.*, (1993) *Science* 261:1411-1418.

Alternatively, NOVX gene expression can be inhibited by targeting nucleotide

10 sequences complementary to the regulatory region of the NOVX nucleic acid (*e.g.*, the NOVX promoter and/or enhancers) to form triple helical structures that prevent transcription of the NOVX gene in target cells. *See, e.g.*, Helene, 1991. *Anticancer Drug Des.* 6: 569-84; Helene, *et al.* 1992. *Ann. N.Y. Acad. Sci.* 660: 27-36; Maher, 1992. *Bioassays* 14: 807-15.

In various embodiments, the NOVX nucleic acids can be modified at the base moiety,

15 sugar moiety or phosphate backbone to improve, *e.g.*, the stability, hybridization, or solubility of the molecule. For example, the deoxyribose phosphate backbone of the nucleic acids can be modified to generate peptide nucleic acids. *See, e.g.*, Hyrup, *et al.*, 1996. *Bioorg Med Chem* 4: 5-23. As used herein, the terms "peptide nucleic acids" or "PNAs" refer to nucleic acid mimics (*e.g.*, DNA mimics) in which the deoxyribose phosphate backbone is replaced by

20 a pseudopeptide backbone and only the four natural nucleotide bases are retained. The neutral backbone of PNAs has been shown to allow for specific hybridization to DNA and RNA under conditions of low ionic strength. The synthesis of PNA oligomer can be performed using standard solid phase peptide synthesis protocols as described in Hyrup, *et al.*, 1996. *supra*; Perry-O'Keefe, *et al.*, 1996. *Proc. Natl. Acad. Sci. USA* 93: 14670-14675.

25 PNAs of NOVX can be used in therapeutic and diagnostic applications. For example, PNAs can be used as antisense or antigene agents for sequence-specific modulation of gene expression by, *e.g.*, inducing transcription or translation arrest or inhibiting replication. PNAs of NOVX can also be used, for example, in the analysis of single base pair mutations in a gene (*e.g.*, PNA directed PCR clamping; as artificial restriction enzymes when used in

30 combination with other enzymes, *e.g.*, S_1 nucleases (*See,* Hyrup, *et al.*, 1996.*supra*); or as probes or primers for DNA sequence and hybridization (*See,* Hyrup, *et al.*, 1996, *supra*; Perry-O'Keefe, *et al.*, 1996. *supra*).

In another embodiment, PNAs of NOVX can be modified, *e.g.*, to enhance their stability or cellular uptake, by attaching lipophilic or other helper groups to PNA, by the

23

formation of PNA-DNA chimeras, or by the use of liposomes or other techniques of drug

delivery known in the art. For example, PNA-DNA chimeras of NOVX can be generated

that may combine the advantageous properties of PNA and DNA. Such chimeras allow DNA

recognition enzymes (e.g., RNase H and DNA polymerases) to interact with the DNA portion

5   while the PNA portion would provide high binding affinity and specificity. PNA-DNA

chimeras can be linked using linkers of appropriate lengths selected in terms of base stacking,

number of bonds between the nucleotide bases, and orientation (see, Hyrup, et al., 1996.

supra). The synthesis of PNA-DNA chimeras can be performed as described in Hyrup, et al.,

1996. supra and Finn, et al., 1996. Nucl Acids Res 24: 3357-3363. For example, a DNA

10   chain can be synthesized on a solid support using standard phosphoramidite coupling

chemistry, and modified nucleoside analogs, e.g.,

5'-(4-methoxytrityl)amino-5'-deoxy-thymidine phosphoramidite, can be used between the

PNA and the 5' end of DNA. See, e.g., Mag, et al., 1989. Nucl Acid Res 17: 5973-5988.

PNA monomers are then coupled in a stepwise manner to produce a chimeric molecule with a

15   5' PNA segment and a 3' DNA segment. See, e.g., Finn, et al., 1996. supra. Alternatively,

chimeric molecules can be synthesized with a 5' DNA segment and a 3' PNA segment. See,

e.g., Petersen, et al., 1975. Bioorg. Med. Chem. Lett. 5: 1119-11124.

In other embodiments, the oligonucleotide may include other appended groups such

as peptides (e.g., for targeting host cell receptors in vivo), or agents facilitating transport

20   across the cell membrane (see, e.g., Letsinger, et al., 1989. Proc. Natl. Acad. Sci. U.S.A. 86:

6553-6556; Lemaitre, et al., 1987. Proc. Natl. Acad. Sci. 84: 648-652; PCT Publication No.

WO88/09810) or the blood-brain barrier (see, e.g., PCT Publication No. WO 89/10134). In

addition, oligonucleotides can be modified with hybridization triggered cleavage agents (see,

e.g., Krol, et al., 1988. BioTechniques 6:958-976) or intercalating agents (see, e.g., Zon,

25   1988. Pharm. Res. 5: 539-549). To this end, the oligonucleotide may be conjugated to

another molecule, e.g., a peptide, a hybridization triggered cross-linking agent, a transport

agent, a hybridization-triggered cleavage agent, and the like.

NOVX Polypeptides

A polypeptide according to the invention includes a polypeptide including the amino

30   acid sequence of NOVX polypeptides whose sequences are provided in any one of SEQ ID

NO:2n, wherein n is an integer between 1-46. The invention also includes a mutant or variant

protein any of whose residues may be changed from the corresponding residues shown in any

one of SEQ ID NO:2n, wherein n is an integer between 1-46, while still encoding a protein

24

that maintains its NOVX activities and physiological functions, or a functional fragment thereof.

In general, a NOVX variant that preserves NOVX-like function includes any variant in which residues at a particular position in the sequence have been substituted by other

5   amino acids, and further include the possibility of inserting an additional residue or residues between two residues of the parent protein as well as the possibility of deleting one or more residues from the parent sequence. Any amino acid substitution, insertion, or deletion is encompassed by the invention. In favorable circumstances, the substitution is a conservative substitution as defined above.

10   One aspect of the invention pertains to isolated NOVX proteins, and biologically-active portions thereof, or derivatives, fragments, analogs or homologs thereof. Also provided are polypeptide fragments suitable for use as immunogens to raise anti-NOVX antibodies. In one embodiment, native NOVX proteins can be isolated from cells or tissue sources by an appropriate purification scheme using standard protein purification techniques.

15   In another embodiment, NOVX proteins are produced by recombinant DNA techniques. Alternative to recombinant expression, a NOVX protein or polypeptide can be synthesized chemically using standard peptide synthesis techniques.

An "isolated" or "purified" polypeptide or protein or biologically-active portion thereof is substantially free of cellular material or other contaminating proteins from the cell

20   or tissue source from which the NOVX protein is derived, or substantially free from chemical precursors or other chemicals when chemically synthesized. The language "substantially free of cellular material" includes preparations of NOVX proteins in which the protein is separated from cellular components of the cells from which it is isolated or recombinantly-produced. In one embodiment, the language "substantially free of cellular material" includes

25   preparations of NOVX proteins having less than about 30% (by dry weight) of non-NOVX proteins (also referred to herein as a "contaminating protein"), more preferably less than about 20% of non-NOVX proteins, still more preferably less than about 10% of non-NOVX proteins, and most preferably less than about 5% of non-NOVX proteins. When the NOVX protein or biologically-active portion thereof is recombinantly-produced, it is also preferably

30   substantially free of culture medium, i.e., culture medium represents less than about 20%, more preferably less than about 10%, and most preferably less than about 5% of the volume of the NOVX protein preparation.

The language "substantially free of chemical precursors or other chemicals" includes preparations of NOVX proteins in which the protein is separated from chemical precursors or

other chemicals that are involved in the synthesis of the protein. In one embodiment, the language "substantially free of chemical precursors or other chemicals" includes preparations of NOVX proteins having less than about 30% (by dry weight) of chemical precursors or non-NOVX chemicals, more preferably less than about 20% chemical precursors or

5   non-NOVX chemicals, still more preferably less than about 10% chemical precursors or non-NOVX chemicals, and most preferably less than about 5% chemical precursors or non-NOVX chemicals.

       Biologically-active portions of NOVX proteins include peptides comprising amino acid sequences sufficiently homologous to or derived from the amino acid sequences of the

10   NOVX proteins (*e.g.*, the amino acid sequence of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46) that include fewer amino acids than the full-length NOVX proteins, and exhibit at least one activity of a NOVX protein. Typically, biologically-active portions comprise a domain or motif with at least one activity of the NOVX protein. A biologically-active portion of a NOVX protein can be a polypeptide which is, for example, 10, 25, 50, 100

15   or more amino acid residues in length.

       Moreover, other biologically-active portions, in which other regions of the protein are deleted, can be prepared by recombinant techniques and evaluated for one or more of the functional activities of a native NOVX protein.

       In an embodiment, the NOVX protein has an amino acid sequence of SEQ ID NO:2*n*,

20   wherein *n* is an integer between 1-46. In other embodiments, the NOVX protein is substantially homologous to SEQ ID NO:2*n*, wherein *n* is an integer between 1-46, and retains the functional activity of the protein of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46, yet differs in amino acid sequence due to natural allelic variation or mutagenesis, as described in detail, below. Accordingly, in another embodiment, the NOVX

25   protein is a protein that comprises an amino acid sequence at least about 45% homologous to the amino acid sequence of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46, and retains the functional activity of the NOVX proteins of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46.

30   **Determining Homology Between Two or More Sequences**

       To determine the percent homology of two amino acid sequences or of two nucleic acids, the sequences are aligned for optimal comparison purposes (*e.g.*, gaps can be introduced in the sequence of a first amino acid or nucleic acid sequence for optimal alignment with a second amino or nucleic acid sequence). The amino acid residues or

26

nucleotides at corresponding amino acid positions or nucleotide positions are then compared. When a position in the first sequence is occupied by the same amino acid residue or nucleotide as the corresponding position in the second sequence, then the molecules are homologous at that position (*i.e.*, as used herein amino acid or nucleic acid "homology" is

5   equivalent to amino acid or nucleic acid "identity").

The nucleic acid sequence homology may be determined as the degree of identity between two sequences. The homology may be determined using computer programs known in the art, such as GAP software provided in the GCG program package. *See,* Needleman and Wunsch, 1970. *J Mol Biol* 48: 443-453. Using GCG GAP software with the following

10   settings for nucleic acid sequence comparison: GAP creation penalty of 5.0 and GAP extension penalty of 0.3, the coding region of the analogous nucleic acid sequences referred to above exhibits a degree of identity preferably of at least 70%, 75%, 80%, 85%, 90%, 95%, 98%, or 99%, with the CDS (encoding) part of the DNA sequence of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46.

15   The term "sequence identity" refers to the degree to which two polynucleotide or polypeptide sequences are identical on a residue-by-residue basis over a particular region of comparison. The term "percentage of sequence identity" is calculated by comparing two optimally aligned sequences over that region of comparison, determining the number of positions at which the identical nucleic acid base (*e.g.,* A, T, C, G, U, or I, in the case of

20   nucleic acids) occurs in both sequences to yield the number of matched positions, dividing the number of matched positions by the total number of positions in the region of comparison (*i.e.,* the window size), and multiplying the result by 100 to yield the percentage of sequence identity. The term "substantial identity" as used herein denotes a characteristic of a polynucleotide sequence, wherein the polynucleotide comprises a sequence that has at least

25   80 percent sequence identity, preferably at least 85 percent identity and often 90 to 95 percent sequence identity, more usually at least 99 percent sequence identity as compared to a reference sequence over a comparison region.

Chimeric and Fusion Proteins

30   The invention also provides NOVX chimeric or fusion proteins. As used herein, a NOVX "chimeric protein" or "fusion protein" comprises a NOVX polypeptide operatively-linked to a non-NOVX polypeptide. An "NOVX polypeptide" refers to a polypeptide having an amino acid sequence corresponding to a NOVX protein of SEQ ID NO:$2n$, wherein n is an integer between 1-46, whereas a "non-NOVX polypeptide" refers to a polypeptide having an

amino acid sequence corresponding to a protein that is not substantially homologous to the NOVX protein, *e.g.*, a protein that is different from the NOVX protein and that is derived from the same or a different organism. Within a NOVX fusion protein the NOVX polypeptide can correspond to all or a portion of a NOVX protein. In one embodiment, a

5   NOVX fusion protein comprises at least one biologically-active portion of a NOVX protein. In another embodiment, a NOVX fusion protein comprises at least two biologically-active portions of a NOVX protein. In yet another embodiment, a NOVX fusion protein comprises at least three biologically-active portions of a NOVX protein. Within the fusion protein, the term "operatively-linked" is intended to indicate that the NOVX polypeptide and the

10   non-NOVX polypeptide are fused in-frame with one another. The non-NOVX polypeptide can be fused to the N-terminus or C-terminus of the NOVX polypeptide.

In one embodiment, the fusion protein is a GST-NOVX fusion protein in which the NOVX sequences are fused to the C-terminus of the GST (glutathione S-transferase) sequences. Such fusion proteins can facilitate the purification of recombinant NOVX

15   polypeptides.

In another embodiment, the fusion protein is a NOVX protein containing a heterologous signal sequence at its N-terminus. In certain host cells (*e.g.*, mammalian host cells), expression and/or secretion of NOVX can be increased through use of a heterologous signal sequence.

20   In yet another embodiment, the fusion protein is a NOVX-immunoglobulin fusion protein in which the NOVX sequences are fused to sequences derived from a member of the immunoglobulin protein family. The NOVX-immunoglobulin fusion proteins of the invention can be incorporated into pharmaceutical compositions and administered to a subject to inhibit an interaction between a NOVX ligand and a NOVX protein on the surface of a

25   cell, to thereby suppress NOVX-mediated signal transduction *in vivo*. The NOVX-immunoglobulin fusion proteins can be used to affect the bioavailability of a NOVX cognate ligand. Inhibition of the NOVX ligand/NOVX interaction may be useful therapeutically for both the treatment of proliferative and differentiative disorders, as well as modulating (*e.g.* promoting or inhibiting) cell survival. Moreover, the NOVX-immunoglobulin fusion

30   proteins of the invention can be used as immunogens to produce anti-NOVX antibodies in a subject, to purify NOVX ligands, and in screening assays to identify molecules that inhibit the interaction of NOVX with a NOVX ligand.

A NOVX chimeric or fusion protein of the invention can be produced by standard recombinant DNA techniques. For example, DNA fragments coding for the different

28

polypeptide sequences are ligated together in-frame in accordance with conventional

techniques, *e.g.*, by employing blunt-ended or stagger-ended termini for ligation, restriction

enzyme digestion to provide for appropriate termini, filling-in of cohesive ends as

appropriate, alkaline phosphatase treatment to avoid undesirable joining, and enzymatic

5   ligation. In another embodiment, the fusion gene can be synthesized by conventional

techniques including automated DNA synthesizers. Alternatively, PCR amplification of gene

fragments can be carried out using anchor primers that give rise to complementary overhangs

between two consecutive gene fragments that can subsequently be annealed and reamplified

to generate a chimeric gene sequence (*see, e.g.*, Ausubel, *et al.* (eds.) CURRENT PROTOCOLS IN

10   MOLECULAR BIOLOGY, John Wiley & Sons, 1992). Moreover, many expression vectors are

commercially available that already encode a fusion moiety (*e.g.*, a GST polypeptide). A

NOVX-encoding nucleic acid can be cloned into such an expression vector such that the

fusion moiety is linked in-frame to the NOVX protein.

15   **NOVX Agonists and Antagonists**

The invention also pertains to variants of the NOVX proteins that function as either

NOVX agonists (*i.e.*, mimetics) or as NOVX antagonists. Variants of the NOVX protein can

be generated by mutagenesis (*e.g.*, discrete point mutation or truncation of the NOVX

protein). An agonist of the NOVX protein can retain substantially the same, or a subset of,

20   the biological activities of the naturally occurring form of the NOVX protein. An antagonist

of the NOVX protein can inhibit one or more of the activities of the naturally occurring form

of the NOVX protein by, for example, competitively binding to a downstream or upstream

member of a cellular signaling cascade which includes the NOVX protein. Thus, specific

biological effects can be elicited by treatment with a variant of limited function. In one

25   embodiment, treatment of a subject with a variant having a subset of the biological activities

of the naturally occurring form of the protein has fewer side effects in a subject relative to

treatment with the naturally occurring form of the NOVX proteins.

Variants of the NOVX proteins that function as either NOVX agonists (*i.e.*, mimetics)

or as NOVX antagonists can be identified by screening combinatorial libraries of mutants

30   (*e.g.*, truncation mutants) of the NOVX proteins for NOVX protein agonist or antagonist

activity. In one embodiment, a variegated library of NOVX variants is generated by

combinatorial mutagenesis at the nucleic acid level and is encoded by a variegated gene

library. A variegated library of NOVX variants can be produced by, for example,

enzymatically ligating a mixture of synthetic oligonucleotides into gene sequences such that a

29

degenerate set of potential NOVX sequences is expressible as individual polypeptides, or alternatively, as a set of larger fusion proteins (*e.g.*, for phage display) containing the set of NOVX sequences therein. There are a variety of methods which can be used to produce libraries of potential NOVX variants from a degenerate oligonucleotide sequence. Chemical

5   synthesis of a degenerate gene sequence can be performed in an automatic DNA synthesizer, and the synthetic gene then ligated into an appropriate expression vector. Use of a degenerate set of genes allows for the provision, in one mixture, of all of the sequences encoding the desired set of potential NOVX sequences. Methods for synthesizing degenerate oligonucleotides are well-known within the art. *See, e.g.*, Narang, 1983. *Tetrahedron* 39: 3;

10   Itakura, *et al.*, 1984. *Annu. Rev. Biochem.* 53: 323; Itakura, *et al.*, 1984. *Science* 198: 1056; Ike, *et al.*, 1983. *Nucl. Acids Res.* 11: 477.

Polypeptide Libraries

In addition, libraries of fragments of the NOVX protein coding sequences can be used

15   to generate a variegated population of NOVX fragments for screening and subsequent selection of variants of a NOVX protein. In one embodiment, a library of coding sequence fragments can be generated by treating a double stranded PCR fragment of a NOVX coding sequence with a nuclease under conditions wherein nicking occurs only about once per molecule, denaturing the double stranded DNA, renaturing the DNA to form double-stranded

20   DNA that can include sense/antisense pairs from different nicked products, removing single stranded portions from reformed duplexes by treatment with S_1 nuclease, and ligating the resulting fragment library into an expression vector. By this method, expression libraries can be derived which encodes N-terminal and internal fragments of various sizes of the NOVX proteins.

25   Various techniques are known in the art for screening gene products of combinatorial libraries made by point mutations or truncation, and for screening cDNA libraries for gene products having a selected property. Such techniques are adaptable for rapid screening of the gene libraries generated by the combinatorial mutagenesis of NOVX proteins. The most widely used techniques, which are amenable to high throughput analysis, for screening large

30   gene libraries typically include cloning the gene library into replicable expression vectors, transforming appropriate cells with the resulting library of vectors, and expressing the combinatorial genes under conditions in which detection of a desired activity facilitates isolation of the vector encoding the gene whose product was detected. Recursive ensemble mutagenesis (REM), a new technique that enhances the frequency of functional mutants in

30

the libraries, can be used in combination with the screening assays to identify NOVX

variants. *See, e.g.,* Arkin and Yourvan, 1992. *Proc. Natl. Acad. Sci. USA* 89: 7811-7815;

Delgrave, *et al.,* 1993. *Protein Engineering* 6:327-331.

NOVX Antibodies

5   The term "antibody" as used herein refers to immunoglobulin molecules and

immunologically active portions of immunoglobulin (Ig) molecules, *i.e.,* molecules that

contain an antigen binding site that specifically binds (immunoreacts with) an antigen. Such

antibodies include, but are not limited to, polyclonal, monoclonal, chimeric, single chain, F_{ab},

$F_{ab'}$ and $F_{(ab')2}$ fragments, and an F_{ab} expression library. In general, antibody molecules

10   obtained from humans relates to any of the classes IgG, IgM, IgA, IgE and IgD, which differ

from one another by the nature of the heavy chain present in the molecule. Certain classes

have subclasses as well, such as IgG_1, IgG_2, and others. Furthermore, in humans, the light

chain may be a kappa chain or a lambda chain. Reference herein to antibodies includes a ·

reference to all such classes, subclasses and types of human antibody species.

15   An isolated protein of the invention intended to serve as an antigen, or a portion or

fragment thereof, can be used as an immunogen to generate antibodies that

immunospecifically bind the antigen, using standard techniques for polyclonal and

monoclonal antibody preparation. The full-length protein can be used or, alternatively, the

invention provides antigenic peptide fragments of the antigen for use as immunogens. An

20   antigenic peptide fragment comprises at least 6 amino acid residues of the amino acid

sequence of the full length protein, such as an amino acid sequence of SEQ ID NO:$2n$,

wherein n is an integer between 1-46, and encompasses an epitope thereof such that an

antibody raised against the peptide forms a specific immune complex with the full length

protein or with any fragment that contains the epitope. Preferably, the antigenic peptide

25   comprises at least 10 amino acid residues, or at least 15 amino acid residues, or at least 20

amino acid residues, or at least 30 amino acid residues. Preferred epitopes encompassed by

the antigenic peptide are regions of the protein that are located on its surface; commonly

these are hydrophilic regions.

          In certain embodiments of the invention, at least one epitope encompassed by the

30   antigenic peptide is a region of NOVX that is located on the surface of the protein, *e.g.,* a

hydrophilic region. A hydrophobicity analysis of the human NOVX protein sequence will

indicate which regions of a NOVX polypeptide are particularly hydrophilic and, therefore,

encode surface residues useful for targeting antibody production. As a means for targeting

antibody production, hydropathy plots showing regions of hydrophilicity and hydrophobicity

may be generated by any method well known in the art, including, for example, the Kyte

Doolittle or the Hopp Woods methods, either with or without Fourier transformation. See,

5   e.g., Hopp and Woods, 1981, *Proc. Nat. Acad. Sci. USA* 78: 3824-3828; Kyte and Doolittle

1982, *J. Mol. Biol.* 157: 105-142, each incorporated herein by reference in their entirety.

Antibodies that are specific for one or more domains within an antigenic protein, or

derivatives, fragments, analogs or homologs thereof, are also provided herein.

The term "epitope" includes any protein determinant capable of specific binding to an

10   immunoglobulin or T-cell receptor.   Epitopic determinants usually consist of chemically

active surface groupings of molecules such as amino acids or sugar side chains and usually

have specific three dimensional structural characteristics, as well as specific charge

characteristics. A NOVX polyppeptide or a fragment thereof comprises at least one antigenic

epitope.   An anti-NOVX antibody of the present invention is said to specifically bind to

15   antigen NOVX when the equilibrium binding constant (K_D) is ≤ 1 µM, preferably ≤ 100 nM,

more preferably ≤ 10 nM, and most preferably ≤ 100 pM to about 1 pM, as measured by

assays such as radioligand binding assays or similar assays known to those skilled in the art.

A protein of the invention, or a derivative, fragment, analog, homolog or ortholog

thereof, may be utilized as an immunogen in the generation of antibodies that

20   immunospecifically bind these protein components.

Various procedures known within the art may be used for the production of

polyclonal or monoclonal antibodies directed against a protein of the invention, or against

derivatives, fragments, analogs homologs or orthologs thereof (see, for example, Antibodies:

A Laboratory Manual, Harlow E, and Lane D, 1988, Cold Spring Harbor Laboratory Press,

25   Cold Spring Harbor, NY, incorporated herein by reference). Some of these antibodies are

discussed below.

Polyclonal Antibodies

For the production of polyclonal antibodies, various suitable host animals (*e.g.*, rabbit,

goat, mouse or other mammal) may be immunized by one or more injections with the native

30   protein, a synthetic variant thereof, or a derivative of the foregoing. An appropriate

immunogenic preparation can contain, for example, the naturally occurring immunogenic

protein, a chemically synthesized polypeptide representing the immunogenic protein, or a

recombinantly expressed immunogenic protein. Furthermore, the protein may be conjugated

32

to a second protein known to be immunogenic in the mammal being immunized. Examples of such immunogenic proteins include but are not limited to keyhole limpet hemocyanin, serum albumin, bovine thyroglobulin, and soybean trypsin inhibitor. The preparation can further include an adjuvant. Various adjuvants used to increase the immunological response

5   include, but are not limited to, Freund's (complete and incomplete), mineral gels (*e.g.*, aluminum hydroxide), surface active substances (*e.g.*, lysolecithin, pluronic polyols, polyanions, peptides, oil emulsions, dinitrophenol, *etc.*), adjuvants usable in humans such as Bacille Calmette-Guerin and Corynebacterium parvum, or similar immunostimulatory agents. Additional examples of adjuvants which can be employed include MPL-TDM adjuvant

10   (monophosphoryl Lipid A, synthetic trehalose dicorynomycolate).

The polyclonal antibody molecules directed against the immunogenic protein can be isolated from the mammal (*e.g.*, from the blood) and further purified by well known techniques, such as affinity chromatography using protein A or protein G, which provide primarily the IgG fraction of immune serum. Subsequently, or alternatively, the specific

15   antigen which is the target of the immunoglobulin sought, or an epitope thereof, may be immobilized on a column to purify the immune specific antibody by immunoaffinity chromatography. Purification of immunoglobulins is discussed, for example, by D. Wilkinson (The Scientist, published by The Scientist, Inc., Philadelphia PA, Vol. 14, No. 8 (April 17, 2000), pp. 25-28).

20

Monoclonal Antibodies

The term "monoclonal antibody" (MAb) or "monoclonal antibody composition", as used herein, refers to a population of antibody molecules that contain only one molecular species of antibody molecule consisting of a unique light chain gene product and a unique

25   heavy chain gene product. In particular, the complementarity determining regions (CDRs) of the monoclonal antibody are identical in all the molecules of the population. MAbs thus contain an antigen binding site capable of immunoreacting with a particular epitope of the antigen characterized by a unique binding affinity for it.

Monoclonal antibodies can be prepared using hybridoma methods, such as those

30   described by Kohler and Milstein, Nature, 256:495 (1975). In a hybridoma method, a mouse, hamster, or other appropriate host animal, is typically immunized with an immunizing agent to elicit lymphocytes that produce or are capable of producing antibodies that will

33

specifically bind to the immunizing agent. Alternatively, the lymphocytes can be immunized in vitro.

The immunizing agent will typically include the protein antigen, a fragment thereof or a fusion protein thereof. Generally, either peripheral blood lymphocytes are used if cells

5   of human origin are desired, or spleen cells or lymph node cells are used if non-human mammalian sources are desired. The lymphocytes are then fused with an immortalized cell line using a suitable fusing agent, such as polyethylene glycol, to form a hybridoma cell [Goding, Monoclonal Antibodies: Principles and Practice, Academic Press, (1986) pp. 59-103]. Immortalized cell lines are usually transformed mammalian cells, particularly

10   myeloma cells of rodent, bovine and human origin. Usually, rat or mouse myeloma cell lines are employed. The hybridoma cells can be cultured in a suitable culture medium that preferably contains one or more substances that inhibit the growth or survival of the unfused, immortalized cells. For example, if the parental cells lack the enzyme hypoxanthine guanine phosphoribosyl transferase (HGPRT or HPRT), the culture medium for the hybridomas

15   typically will include hypoxanthine, aminopterin, and thymidine ("HAT medium"), which substances prevent the growth of HGPRT-deficient cells.

Preferred immortalized cell lines are those that fuse efficiently, support stable high level expression of antibody by the selected antibody-producing cells, and are sensitive to a medium such as HAT medium. More preferred immortalized cell lines are murine myeloma

20   lines, which can be obtained, for instance, from the Salk Institute Cell Distribution Center, San Diego, California and the American Type Culture Collection, Manassas, Virginia. Human myeloma and mouse-human heteromyeloma cell lines also have been described for the production of human monoclonal antibodies [Kozbor, J. Immunol., 133:3001 (1984); Brodeur et al., Monoclonal Antibody Production Techniques and Applications, Marcel

25   Dekker, Inc., New York, (1987) pp. 51-63].

The culture medium in which the hybridoma cells are cultured can then be assayed for the presence of monoclonal antibodies directed against the antigen. Preferably, the binding specificity of monoclonal antibodies produced by the hybridoma cells is determined by immunoprecipitation or by an in vitro binding assay, such as radioimmunoassay (RIA) or

30   enzyme-linked immunoabsorbent assay (ELISA). Such techniques and assays are known in the art. The binding affinity of the monoclonal antibody can, for example, be determined by the Scatchard analysis of Munson and Pollard, Anal. Biochem., 107:220 (1980). It is an objective, especially important in therapeutic applications of monoclonal antibodies, to

identify antibodies having a high degree of specificity and a high binding affinity for the target antigen.

After the desired hybridoma cells are identified, the clones can be subcloned by limiting dilution procedures and grown by standard methods (Goding,1986). Suitable culture media for this purpose include, for example, Dulbecco's Modified Eagle's Medium and RPMI-1640 medium. Alternatively, the hybridoma cells can be grown in vivo as ascites in a mammal.

The monoclonal antibodies secreted by the subclones can be isolated or purified from the culture medium or ascites fluid by conventional immunoglobulin purification procedures such as, for example, protein A-Sepharose, hydroxylapatite chromatography, gel electrophoresis, dialysis, or affinity chromatography.

The monoclonal antibodies can also be made by recombinant DNA methods, such as those described in U.S. Patent No. 4,816,567. DNA encoding the monoclonal antibodies of the invention can be readily isolated and sequenced using conventional procedures (*e.g.*, by using oligonucleotide probes that are capable of binding specifically to genes encoding the heavy and light chains of murine antibodies). The hybridoma cells of the invention serve as a preferred source of such DNA. Once isolated, the DNA can be placed into expression vectors, which are then transfected into host cells such as simian COS cells, Chinese hamster ovary (CHO) cells, or myeloma cells that do not otherwise produce immunoglobulin protein, to obtain the synthesis of monoclonal antibodies in the recombinant host cells. The DNA also can be modified, for example, by substituting the coding sequence for human heavy and light chain constant domains in place of the homologous murine sequences (U.S. Patent No. 4,816,567; Morrison, Nature 368, 812-13 (1994)) or by covalently joining to the immunoglobulin coding sequence all or part of the coding sequence for a non-immunoglobulin polypeptide. Such a non-immunoglobulin polypeptide can be substituted for the constant domains of an antibody of the invention, or can be substituted for the variable domains of one antigen-combining site of an antibody of the invention to create a chimeric bivalent antibody.

Humanized Antibodies

The antibodies directed against the protein antigens of the invention can further comprise humanized antibodies or human antibodies. These antibodies are suitable for administration to humans without engendering an immune response by the human against the administered immunoglobulin. Humanized forms of antibodies are chimeric

immunoglobulins, immunoglobulin chains or fragments thereof (such as Fv, Fab, Fab', F(ab')$_2$ or other antigen-binding subsequences of antibodies) that are principally comprised of the sequence of a human immunoglobulin, and contain minimal sequence derived from a non-human immunoglobulin. Humanization can be performed following the method of Winter

5   and co-workers (Jones et al., Nature, 321:522-525 (1986); Riechmann et al., Nature, 332:323-327 (1988); Verhoeyen et al., Science, 239:1534-1536 (1988)), by substituting rodent CDRs or CDR sequences for the corresponding sequences of a human antibody. (See also U.S. Patent No. 5,225,539.) In some instances, Fv framework residues of the human immunoglobulin are replaced by corresponding non-human residues. Humanized antibodies

10   can also comprise residues which are found neither in the recipient antibody nor in the imported CDR or framework sequences. In general, the humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the CDR regions correspond to those of a non-human immunoglobulin and all or substantially all of the framework regions are those of a human immunoglobulin

15   consensus sequence. The humanized antibody optimally also will comprise at least a portion of an immunoglobulin constant region (Fc), typically that of a human immunoglobulin (Jones et al., 1986; Riechmann et al., 1988; and Presta, Curr. Op. Struct. Biol., 2:593-596 (1992)).

Human Antibodies

20   Fully human antibodies essentially relate to antibody molecules in which the entire sequence of both the light chain and the heavy chain, including the CDRs, arise from human genes. Such antibodies are termed "human antibodies", or "fully human antibodies" herein. Human monoclonal antibodies can be prepared by the trioma technique; the human B-cell hybridoma technique (see Kozbor, et al., 1983 Immunol Today 4: 72) and the EBV

25   hybridoma technique to produce human monoclonal antibodies (see Cole, et al., 1985 In: MONOCLONAL ANTIBODIES AND CANCER THERAPY, Alan R. Liss, Inc., pp. 77-96). Human monoclonal antibodies may be utilized in the practice of the present invention and may be produced by using human hybridomas (see Cote, et al., 1983. Proc Natl Acad Sci USA 80: 2026-2030) or by transforming human B-cells with Epstein Barr Virus in vitro (see Cole, et

30   al., 1985 In: MONOCLONAL ANTIBODIES AND CANCER THERAPY, Alan R. Liss, Inc., pp. 77-96).

In addition, human antibodies can also be produced using additional techniques, including phage display libraries (Hoogenboom and Winter, J. Mol. Biol., 227:381 (1991);

36

Marks et al., J. Mol. Biol., 222:581 (1991)). Similarly, human antibodies can be made by introducing human immunoglobulin loci into transgenic animals, e.g., mice in which the endogenous immunoglobulin genes have been partially or completely inactivated. Upon challenge, human antibody production is observed, which closely resembles that seen in

5   humans in all respects, including gene rearrangement, assembly, and antibody repertoire. This approach is described, for example, in U.S. Patent Nos. 5,545,807; 5,545,806; 5,569,825; 5,625,126; 5,633,425; 5,661,016, and in Marks et al. (Bio/Technology 10, 779-783 (1992)); Lonberg et al. (Nature 368 856-859 (1994)); Morrison (Nature 368, 812-13 (1994)); Fishwild et al,(Nature Biotechnology 14, 845-51 (1996)); Neuberger (Nature

10   Biotechnology 14, 826 (1996)); and Lonberg and Huszar (Intern. Rev. Immunol. 13 65-93 (1995)).

Human antibodies may additionally be produced using transgenic nonhuman animals which are modified so as to produce fully human antibodies rather than the animal's endogenous antibodies in response to challenge by an antigen. (See PCT publication

15   WO94/02602). The endogenous genes encoding the heavy and light immunoglobulin chains in the nonhuman host have been incapacitated, and active loci encoding human heavy and light chain immunoglobulins are inserted into the host's genome. The human genes are incorporated, for example, using yeast artificial chromosomes containing the requisite human DNA segments. An animal which provides all the desired modifications is then obtained as

20   progeny by crossbreeding intermediate transgenic animals containing fewer than the full complement of the modifications. The preferred embodiment of such a nonhuman animal is a mouse, and is termed the Xenomouse™ as disclosed in PCT publications WO 96/33735 and WO 96/34096. This animal produces B cells which secrete fully human immunoglobulins. The antibodies can be obtained directly from the animal after

25   immunization with an immunogen of interest, as, for example, a preparation of a polyclonal antibody, or alternatively from immortalized B cells derived from the animal, such as hybridomas producing monoclonal antibodies. Additionally, the genes encoding the immunoglobulins with human variable regions can be recovered and expressed to obtain the antibodies directly, or can be further modified to obtain analogs of antibodies such as, for

30   example, single chain Fv molecules.

An example of a method of producing a nonhuman host, exemplified as a mouse, lacking expression of an endogenous immunoglobulin heavy chain is disclosed in U.S. Patent No. 5,939,598. It can be obtained by a method including deleting the J segment genes from at least one endogenous heavy chain locus in an embryonic stem cell to prevent

rearrangement of the locus and to prevent formation of a transcript of a rearranged immunoglobulin heavy chain locus, the deletion being effected by a targeting vector containing a gene encoding a selectable marker; and producing from the embryonic stem cell a transgenic mouse whose somatic and germ cells contain the gene encoding the selectable ·

5   marker.

A method for producing an antibody of interest, such as a human antibody, is disclosed in U.S. Patent No. 5,916,771. It includes introducing an expression vector that contains a nucleotide sequence encoding a heavy chain into one mammalian host cell in culture, introducing an expression vector containing a nucleotide sequence encoding a light

10   chain into another mammalian host cell, and fusing the two cells to form a hybrid cell. The hybrid cell expresses an antibody containing the heavy chain and the light chain.

In a further improvement on this procedure, a method for identifying a clinically relevant epitope on an immunogen, and a correlative method for selecting an antibody that binds immunospecifically to the relevant epitope with high affinity, are disclosed in PCT

15   publication WO 99/53049.

F_{ab} Fragments and Single Chain Antibodies

According to the invention, techniques can be adapted for the production of single-chain antibodies specific to an antigenic protein of the invention (see *e.g.*, U.S. Patent

20   No. 4,946,778). In addition, methods can be adapted for the construction of F_{ab} expression libraries (see *e.g.*, Huse, et al., 1989 Science 246: 1275-1281) to allow rapid and effective identification of monoclonal F_{ab} fragments with the desired specificity for a protein or derivatives, fragments, analogs or homologs thereof. Antibody fragments that contain the idiotypes to a protein antigen may be produced by techniques known in the art including, but

25   not limited to: (i) an $F_{(ab')2}$ fragment produced by pepsin digestion of an antibody molecule; (ii) an F_{ab} fragment generated by reducing the disulfide bridges of an $F_{(ab')2}$ fragment; (iii) an F_{ab} fragment generated by the treatment of the antibody molecule with papain and a reducing agent and (iv) F_v fragments.

Bispecific Antibodies

30   Bispecific antibodies are monoclonal, preferably human or humanized, antibodies that have binding specificities for at least two different antigens. In the present case, one of the

binding specificities is for an antigenic protein of the invention. The second binding target is any other antigen, and advantageously is a cell-surface protein or receptor or receptor subunit.

Methods for making bispecific antibodies are known in the art. Traditionally, the recombinant production of bispecific antibodies is based on the co-expression of two immunoglobulin heavy-chain/light-chain pairs, where the two heavy chains have different specificities (Milstein and Cuello, Nature, 305:537-539 (1983)). Because of the random assortment of immunoglobulin heavy and light chains, these hybridomas (quadromas) produce a potential mixture of ten different antibody molecules, of which only one has the correct bispecific structure. The purification of the correct molecule is usually accomplished by affinity chromatography steps. Similar procedures are disclosed in WO 93/08829, published 13 May 1993, and in Traunecker et al., EMBO J., 10:3655-3659 (1991).

Antibody variable domains with the desired binding specificities (antibody-antigen combining sites) can be fused to immunoglobulin constant domain sequences. The fusion preferably is with an immunoglobulin heavy-chain constant domain, comprising at least part of the hinge, CH2, and CH3 regions. It is preferred to have the first heavy-chain constant region (CH1) containing the site necessary for light-chain binding present in at least one of the fusions. DNAs encoding the immunoglobulin heavy-chain fusions and, if desired, the immunoglobulin light chain, are inserted into separate expression vectors, and are co-transfected into a suitable host organism. For further details of generating bispecific antibodies see, for example, Suresh et al., Methods in Enzymology, 121:210 (1986).

According to another approach described in WO 96/27011, the interface between a pair of antibody molecules can be engineered to maximize the percentage of heterodimers which are recovered from recombinant cell culture. The preferred interface comprises at least a part of the CH3 region of an antibody constant domain. In this method, one or more small amino acid side chains from the interface of the first antibody molecule are replaced with larger side chains (*e.g.* tyrosine or tryptophan). Compensatory "cavities" of identical or similar size to the large side chain(s) are created on the interface of the second antibody molecule by replacing large amino acid side chains with smaller ones (*e.g.* alanine or threonine). This provides a mechanism for increasing the yield of the heterodimer over other unwanted end-products such as homodimers.

Bispecific antibodies can be prepared as full length antibodies or antibody fragments (*e.g.* F(ab')$_2$ bispecific antibodies). Techniques for generating bispecific antibodies from antibody fragments have been described in the literature. For example, bispecific antibodies

39

can be prepared using chemical linkage. Brennan et al., Science 229:81 (1985) describe a procedure wherein intact antibodies are proteolytically cleaved to generate $F(ab')_2$ fragments. These fragments are reduced in the presence of the dithiol complexing agent sodium arsenite to stabilize vicinal dithiols and prevent intermolecular disulfide formation. The Fab'

5   fragments generated are then converted to thionitrobenzoate (TNB) derivatives. One of the Fab'-TNB derivatives is then reconverted to the Fab'-thiol by reduction with mercaptoethylamine and is mixed with an equimolar amount of the other Fab'-TNB derivative to form the bispecific antibody. The bispecific antibodies produced can be used as agents for the selective immobilization of enzymes.

10   Additionally, Fab' fragments can be directly recovered from E. coli and chemically coupled to form bispecific antibodies. Shalaby et al., J. Exp. Med. 175:217-225 (1992) describe the production of a fully humanized bispecific antibody $F(ab')_2$ molecule. Each Fab' fragment was separately secreted from E. coli and subjected to directed chemical coupling in vitro to form the bispecific antibody. The bispecific antibody thus formed was

15   able to bind to cells overexpressing the ErbB2 receptor and normal human T cells, as well as trigger the lytic activity of human cytotoxic lymphocytes against human breast tumor targets.

    Various techniques for making and isolating bispecific antibody fragments directly from recombinant cell culture have also been described. For example, bispecific antibodies have been produced using leucine zippers. Kostelny et al., J. Immunol. 148(5):1547-1553

20   (1992). The leucine zipper peptides from the Fos and Jun proteins were linked to the Fab' portions of two different antibodies by gene fusion. The antibody homodimers were reduced at the hinge region to form monomers and then re-oxidized to form the antibody heterodimers. This method can also be utilized for the production of antibody homodimers. The "diabody" technology described by Hollinger et al., Proc. Natl. Acad. Sci. USA

25   90:6444-6448 (1993) has provided an alternative mechanism for making bispecific antibody fragments. The fragments comprise a heavy-chain variable domain (V_H) connected to a light-chain variable domain (V_L) by a linker which is too short to allow pairing between the two domains on the same chain. Accordingly, the V_H and V_L domains of one fragment are forced to pair with the complementary V_L and V_H domains of another fragment, thereby

30   forming two antigen-binding sites. Another strategy for making bispecific antibody fragments by the use of single-chain Fv (sFv) dimers has also been reported. See, Gruber et al., J. Immunol. 152:5368 (1994).

    Antibodies with more than two valencies are contemplated. For example, trispecific antibodies can be prepared. Tutt et al., J. Immunol. 147:60 (1991).

Exemplary bispecific antibodies can bind to two different epitopes, at least one of which originates in the protein antigen of the invention. Alternatively, an anti-antigenic arm of an immunoglobulin molecule can be combined with an arm which binds to a triggering molecule on a leukocyte such as a T-cell receptor molecule (e.g. CD2, CD3, CD28, or B7), or

5   Fc receptors for IgG (FcγR), such as FcγRI (CD64), FcγRII (CD32) and FcγRIII (CD16) so as to focus cellular defense mechanisms to the cell expressing the particular antigen. Bispecific antibodies can also be used to direct cytotoxic agents to cells which express a particular antigen. These antibodies possess an antigen-binding arm and an arm which binds a cytotoxic agent or a radionuclide chelator, such as EOTUBE, DPTA, DOTA, or TETA.

10   Another bispecific antibody of interest binds the protein antigen described herein and further binds tissue factor (TF).

Heteroconjugate Antibodies

Heteroconjugate antibodies are also within the scope of the present invention.

15   Heteroconjugate antibodies are composed of two covalently joined antibodies. Such antibodies have, for example, been proposed to target immune system cells to unwanted cells (U.S. Patent No. 4,676,980), and for treatment of HIV infection (WO 91/00360; WO 92/200373; EP 03089). It is contemplated that the antibodies can be prepared in vitro using known methods in synthetic protein chemistry, including those involving crosslinking agents.

20   For example, immunotoxins can be constructed using a disulfide exchange reaction or by forming a thioether bond. Examples of suitable reagents for this purpose include iminothiolate and methyl-4-mercaptobutyrimidate and those disclosed, for example, in U.S. Patent No. 4,676,980.

25   ### Effector Function Engineering

It can be desirable to modify the antibody of the invention with respect to effector function, so as to enhance, e.g., the effectiveness of the antibody in treating cancer. For example, cysteine residue(s) can be introduced into the Fc region, thereby allowing interchain disulfide bond formation in this region. The homodimeric antibody thus generated can have

30   improved internalization capability and/or increased complement-mediated cell killing and antibody-dependent cellular cytotoxicity (ADCC). See Caron et al., J. Exp Med., 176: 1191-1195 (1992) and Shopes, J. Immunol., 148: 2918-2922 (1992). Homodimeric antibodies with enhanced anti-tumor activity can also be prepared using heterobifunctional cross-linkers as described in Wolff et al. Cancer Research, 53: 2560-2565 (1993). Alternatively, an antibody

can be engineered that has dual Fc regions and can thereby have enhanced complement lysis and ADCC capabilities. See Stevenson et al., Anti-Cancer Drug Design, 3: 219-230 (1989).

Immunoconjugates

5   The invention also pertains to immunoconjugates comprising an antibody conjugated to a cytotoxic agent such as a chemotherapeutic agent, toxin (e.g., an enzymatically active toxin of bacterial, fungal, plant, or animal origin, or fragments thereof), or a radioactive isotope (i.e., a radioconjugate).

Chemotherapeutic agents useful in the generation of such immunoconjugates have
10   been described above. Enzymatically active toxins and fragments thereof that can be used include diphtheria A chain, nonbinding active fragments of diphtheria toxin, exotoxin A chain (from Pseudomonas aeruginosa), ricin A chain, abrin A chain, modeccin A chain, alpha-sarcin, Aleurites fordii proteins, dianthin proteins, Phytolaca americana proteins (PAPI, PAPII, and PAP-S), momordica charantia inhibitor, curcin, crotin, sapaonaria officinalis
15   inhibitor, gelonin, mitogellin, restrictocin, phenomycin, enomycin, and the tricothecenes. A variety of radionuclides are available for the production of radioconjugated antibodies. Examples include ^{212}Bi, ^{131}I, ^{131}In, ^{90}Y, and ^{186}Re.

Conjugates of the antibody and cytotoxic agent are made using a variety of bifunctional protein-coupling agents such as N-succinimidyl-3-(2-pyridyldithiol) propionate
20   (SPDP), iminothiolane (IT), bifunctional derivatives of imidoesters (such as dimethyl adipimidate HCL), active esters (such as disuccinimidyl suberate), aldehydes (such as glutareldehyde), bis-azido compounds (such as bis (p-azidobenzoyl) hexanediamine), bis-diazonium derivatives (such as bis-(p-diazoniumbenzoyl)-ethylenediamine), diisocyanates (such as tolyene 2,6-diisocyanate), and bis-active fluorine compounds (such as 1,5-difluoro-
25   2,4-dinitrobenzene). For example, a ricin immunotoxin can be prepared as described in Vitetta et al., Science, 238: 1098 (1987). Carbon-14-labeled 1-isothiocyanatobenzyl-3-methyldiethylene triaminepentaacetic acid (MX-DTPA) is an exemplary chelating agent for conjugation of radionucleotide to the antibody. See WO94/11026.

In another embodiment, the antibody can be conjugated to a "receptor" (such
30   streptavidin) for utilization in tumor pretargeting wherein the antibody-receptor conjugate is administered to the patient, followed by removal of unbound conjugate from the circulation using a clearing agent and then administration of a "ligand" (e.g., avidin) that is in turn conjugated to a cytotoxic agent.

Immunoliposomes

The antibodies disclosed herein can also be formulated as immunoliposomes. Liposomes containing the antibody are prepared by methods known in the art, such as described in Epstein et al., Proc. Natl. Acad. Sci. USA, 82: 3688 (1985); Hwang et al., Proc. Natl Acad. Sci. USA, 77: 4030 (1980); and U.S. Pat. Nos. 4,485,045 and 4,544,545. Liposomes with enhanced circulation time are disclosed in U.S. Patent No. 5,013,556.

Particularly useful liposomes can be generated by the reverse-phase evaporation method with a lipid composition comprising phosphatidylcholine, cholesterol, and PEG-derivatized phosphatidylethanolamine (PEG-PE). Liposomes are extruded through filters of defined pore size to yield liposomes with the desired diameter. Fab' fragments of the antibody of the present invention can be conjugated to the liposomes as described in Martin et al .,J. Biol. Chem., 257: 286-288 (1982) via a disulfide-interchange reaction. A chemotherapeutic agent (such as Doxorubicin) is optionally contained within the liposome. See Gabizon et al., J. National Cancer Inst., 81(19): 1484 (1989).

Diagnostic Applications of Antibodies Directed Against the Proteins of the Invention

Antibodies directed against a protein of the invention may be used in methods known within the art relating to the localization and/or quantitation of the protein (*e.g.*, for use in measuring levels of the protein within appropriate physiological samples, for use in diagnostic methods, for use in imaging the protein, and the like). In a given embodiment, antibodies against the proteins, or derivatives, fragments, analogs or homologs thereof, that contain the antigen binding domain, are utilized as pharmacologically-active compounds (see below).

An antibody specific for a protein of the invention can be used to isolate the protein by standard techniques, such as immunoaffinity chromatography or immunoprecipitation. Such an antibody can facilitate the purification of the natural protein antigen from cells and of recombinantly produced antigen expressed in host cells. Moreover, such an antibody can be used to detect the antigenic protein (*e.g.*, in a cellular lysate or cell supernatant) in order to evaluate the abundance and pattern of expression of the antigenic protein. Antibodies directed against the protein can be used diagnostically to monitor protein levels in tissue as part of a clinical testing procedure, *e.g.*, to, for example, determine the efficacy of a given treatment regimen. Detection can be facilitated by coupling (*i.e.*, physically linking) the

43

antibody to a detectable substance. Examples of detectable substances include various enzymes, prosthetic groups, fluorescent materials, luminescent materials, bioluminescent materials, and radioactive materials. Examples of suitable enzymes include horseradish peroxidase, alkaline phosphatase, β-galactosidase, or acetylcholinesterase; examples of

5   suitable prosthetic group complexes include streptavidin/biotin and avidin/biotin; examples of suitable fluorescent materials include umbelliferone, fluorescein, fluorescein isothiocyanate, rhodamine, dichlorotriazinylamine fluorescein, dansyl chloride or phycoerythrin; an example of a luminescent material includes luminol; examples of bioluminescent materials include luciferase, luciferin, and aequorin, and examples of suitable

10   radioactive material include ^{125}I, ^{131}I, ^{35}S or ^{3}H.

Antibody Therapeutics

Antibodies of the invention, including polyclonal, monoclonal, humanized and fully

15   human antibodies, may used as therapeutic agents. Such agents will generally be employed to treat or prevent a disease or pathology in a subject. An antibody preparation, preferably one having high specificity and high affinity for its target antigen, is administered to the subject and will generally have an effect due to its binding with the target. Such an effect may be one of two kinds, depending on the specific nature of the interaction between the

20   given antibody molecule and the target antigen in question. In the first instance, administration of the antibody may abrogate or inhibit the binding of the target with an endogenous ligand to which it naturally binds. In this case, the antibody binds to the target and masks a binding site of the naturally occurring ligand, wherein the ligand serves as an effector molecule. Thus the receptor mediates a signal transduction pathway for which ligand

25   is responsible.

Alternatively, the effect may be one in which the antibody elicits a physiological result by virtue of binding to an effector binding site on the target molecule. In this case the target, a receptor having an endogenous ligand which may be absent or defective in the disease or pathology, binds the antibody as a surrogate effector ligand, initiating a receptor-

30   based signal transduction event by the receptor.

A therapeutically effective amount of an antibody of the invention relates generally to the amount needed to achieve a therapeutic objective. As noted above, this may be a binding interaction between the antibody and its target antigen that, in certain cases, interferes with

44

the functioning of the target, and in other cases, promotes a physiological response. The amount required to be administered will furthermore depend on the binding affinity of the antibody for its specific antigen, and will also depend on the rate at which an administered antibody is depleted from the free volume other subject to which it is administered. Common

5   ranges for therapeutically effective dosing of an antibody or antibody fragment of the invention may be, by way of nonlimiting example, from about 0.1 mg/kg body weight to about 50 mg/kg body weight. Common dosing frequencies may range, for example, from twice daily to once a week.

10   **Pharmaceutical Compositions of Antibodies**

Antibodies specifically binding a protein of the invention, as well as other molecules identified by the screening assays disclosed herein, can be administered for the treatment of various disorders in the form of pharmaceutical compositions. Principles and considerations involved in preparing such compositions, as well as guidance in the choice of components are

15   provided, for example, in Remington : The Science And Practice Of Pharmacy 19th ed. (Alfonso R. Gennaro, et al., editors) Mack Pub. Co., Easton, Pa. : 1995; Drug Absorption Enhancement : Concepts, Possibilities, Limitations, And Trends, Harwood Academic Publishers, Langhorne, Pa., 1994; and Peptide And Protein Drug Delivery (Advances In Parenteral Sciences, Vol. 4), 1991, M. Dekker, New York.

20   If the antigenic protein is intracellular and whole antibodies are used as inhibitors, internalizing antibodies are preferred. However, liposomes can also be used to deliver the antibody, or an antibody fragment, into cells. Where antibody fragments are used, the smallest inhibitory fragment that specifically binds to the binding domain of the target protein is preferred. For example, based upon the variable-region sequences of an antibody, peptide

25   molecules can be designed that retain the ability to bind the target protein sequence. Such peptides can be synthesized chemically and/or produced by recombinant DNA technology. See, *e.g.*, Marasco et al., Proc. Natl. Acad. Sci. USA, 90: 7889-7893 (1993). The formulation herein can also contain more than one active compound as necessary for the particular indication being treated, preferably those with complementary activities that do not

30   adversely affect each other. Alternatively, or in addition, the composition can comprise an agent that enhances its function, such as, for example, a cytotoxic agent, cytokine, chemotherapeutic agent, or growth-inhibitory agent. Such molecules are suitably present in combination in amounts that are effective for the purpose intended.

The active ingredients can also be entrapped in microcapsules prepared, for example, by coacervation techniques or by interfacial polymerization, for example, hydroxymethylcellulose or gelatin-microcapsules and poly-(methylmethacrylate) microcapsules, respectively, in colloidal drug delivery systems (for example, liposomes,

5   albumin microspheres, microemulsions, nano-particles, and nanocapsules) or in macroemulsions.

The formulations to be used for in vivo administration must be sterile. This is readily accomplished by filtration through sterile filtration membranes.

Sustained-release preparations can be prepared. Suitable examples of sustained-

10   release preparations include semipermeable matrices of solid hydrophobic polymers containing the antibody, which matrices are in the form of shaped articles, e.g., films, or microcapsules. Examples of sustained-release matrices include polyesters, hydrogels (for example, poly(2-hydroxyethyl-methacrylate), or poly(vinylalcohol)), polylactides (U.S. Pat. No. 3,773,919), copolymers of L-glutamic acid and γ ethyl-L-glutamate, non-degradable

15   ethylene-vinyl acetate, degradable lactic acid-glycolic acid copolymers such as the LUPRON DEPOT ™ (injectable microspheres composed of lactic acid-glycolic acid copolymer and leuprolide acetate), and poly-D-(-)-3-hydroxybutyric acid. While polymers such as ethylene-vinyl acetate and lactic acid-glycolic acid enable release of molecules for over 100 days, certain hydrogels release proteins for shorter time periods.

20

ELISA Assay

An agent for detecting an analyte protein is an antibody capable of binding to an analyte protein, preferably an antibody with a detectable label. Antibodies can be polyclonal, or more preferably, monoclonal. An intact antibody, or a fragment thereof (e.g., F_{ab} or $F_{(ab)2}$)

25   can be used. The term "labeled", with regard to the probe or antibody, is intended to encompass direct labeling of the probe or antibody by coupling (i.e., physically linking) a detectable substance to the probe or antibody, as well as indirect labeling of the probe or antibody by reactivity with another reagent that is directly labeled. Examples of indirect labeling include detection of a primary antibody using a fluorescently-labeled secondary

30   antibody and end-labeling of a DNA probe with biotin such that it can be detected with fluorescently-labeled streptavidin. The term "biological sample" is intended to include tissues, cells and biological fluids isolated from a subject, as well as tissues, cells and fluids present within a subject. Included within the usage of the term "biological sample", therefore, is blood and a fraction or component of blood including blood serum, blood

plasma, or lymph. That is, the detection method of the invention can be used to detect an analyte mRNA, protein, or genomic DNA in a biological sample *in vitro* as well as *in vivo*. For example, *in vitro* techniques for detection of an analyte mRNA include Northern hybridizations and *in situ* hybridizations. *In vitro* techniques for detection of an analyte

5   protein include enzyme linked immunosorbent assays (ELISAs), Western blots, immunoprecipitations, and immunofluorescence. *In vitro* techniques for detection of an analyte genomic DNA include Southern hybridizations. Procedures for conducting immunoassays are described, for example in "ELISA: Theory and Practice: Methods in Molecular Biology", Vol. 42, J. R. Crowther (Ed.) Human Press, Totowa, NJ, 1995;

10   "Immunoassay", E. Diamandis and T. Christopoulus, Academic Press, Inc., San Diego, CA, 1996; and "Practice and Thory of Enzyme Immunoassays", P. Tijssen, Elsevier Science Publishers, Amsterdam, 1985. Furthermore, *in vivo* techniques for detection of an analyte protein include introducing into a subject a labeled anti-an analyte protein antibody. For example, the antibody can be labeled with a radioactive marker whose presence and location

15   in a subject can be detected by standard imaging techniques.

NOVX Recombinant Expression Vectors and Host Cells

Another aspect of the invention pertains to vectors, preferably expression vectors, containing a nucleic acid encoding a NOVX protein, or derivatives, fragments, analogs or

20   homologs thereof. As used herein, the term "vector" refers to a nucleic acid molecule capable of transporting another nucleic acid to which it has been linked. One type of vector is a "plasmid", which refers to a circular double stranded DNA loop into which additional DNA segments can be ligated. Another type of vector is a viral vector, wherein additional DNA segments can be ligated into the viral genome. Certain vectors are capable of autonomous

25   replication in a host cell into which they are introduced (*e.g.*, bacterial vectors having a bacterial origin of replication and episomal mammalian vectors). Other vectors (*e.g.*, non-episomal mammalian vectors) are integrated into the genome of a host cell upon introduction into the host cell, and thereby are replicated along with the host genome. Moreover, certain vectors are capable of directing the expression of genes to which they are

30   operatively-linked. Such vectors are referred to herein as "expression vectors". In general, expression vectors of utility in recombinant DNA techniques are often in the form of plasmids. In the present specification, "plasmid" and "vector" can be used interchangeably as the plasmid is the most commonly used form of vector. However, the invention is intended

to include such other forms of expression vectors, such as viral vectors (*e.g.*, replication defective retroviruses, adenoviruses and adeno-associated viruses), which serve equivalent functions.

The recombinant expression vectors of the invention comprise a nucleic acid of the
5   invention in a form suitable for expression of the nucleic acid in a host cell, which means that the recombinant expression vectors include one or more regulatory sequences, selected on the basis of the host cells to be used for expression, that is operatively-linked to the nucleic acid sequence to be expressed. Within a recombinant expression vector, "operably-linked" is intended to mean that the nucleotide sequence of interest is linked to the regulatory
10 sequence(s) in a manner that allows for expression of the nucleotide sequence (*e.g.*, in an *in vitro* transcription/translation system or in a host cell when the vector is introduced into the host cell).

The term "regulatory sequence" is intended to includes promoters, enhancers and other expression control elements (*e.g.*, polyadenylation signals). Such regulatory sequences
15 are described, for example, in Goeddel, GENE EXPRESSION TECHNOLOGY: METHODS IN ENZYMOLOGY 185, Academic Press, San Diego, Calif. (1990). Regulatory sequences include those that direct constitutive expression of a nucleotide sequence in many types of host cell and those that direct expression of the nucleotide sequence only in certain host cells (*e.g.*, tissue-specific regulatory sequences). It will be appreciated by those skilled in the art that the
20 design of the expression vector can depend on such factors as the choice of the host cell to be transformed, the level of expression of protein desired, *etc.*. The expression vectors of the invention can be introduced into host cells to thereby produce proteins or peptides, including fusion proteins or peptides, encoded by nucleic acids as described herein (*e.g.*, NOVX proteins, mutant forms of NOVX proteins, fusion proteins, *etc.*).

25 The recombinant expression vectors of the invention can be designed for expression of NOVX proteins in prokaryotic or eukaryotic cells. For example, NOVX proteins can be expressed in bacterial cells such as *Escherichia coli*, insect cells (using baculovirus expression vectors) yeast cells or mammalian cells. Suitable host cells are discussed further in Goeddel, GENE EXPRESSION TECHNOLOGY: METHODS IN ENZYMOLOGY 185, Academic Press,
30 San Diego, Calif. (1990). Alternatively, the recombinant expression vector can be transcribed and translated *in vitro*, for example using T7 promoter regulatory sequences and T7 polymerase.

Expression of proteins in prokaryotes is most often carried out in *Escherichia coli* with vectors containing constitutive or inducible promoters directing the expression of either

48

fusion or non-fusion proteins. Fusion vectors add a number of amino acids to a protein encoded therein, usually to the amino terminus of the recombinant protein. Such fusion vectors typically serve three purposes: (*i*) to increase expression of recombinant protein; (*ii*) to increase the solubility of the recombinant protein; and (*iii*) to aid in the purification of the

5   recombinant protein by acting as a ligand in affinity purification. Often, in fusion expression vectors, a proteolytic cleavage site is introduced at the junction of the fusion moiety and the recombinant protein to enable separation of the recombinant protein from the fusion moiety subsequent to purification of the fusion protein. Such enzymes, and their cognate recognition sequences, include Factor Xa, thrombin and enterokinase. Typical fusion expression vectors

10   include pGEX (Pharmacia Biotech Inc; Smith and Johnson, 1988. *Gene* 67: 31-40), pMAL (New England Biolabs, Beverly, Mass.) and pRIT5 (Pharmacia, Piscataway, N.J.) that fuse glutathione S-transferase (GST), maltose E binding protein, or protein A, respectively, to the target recombinant protein.

Examples of suitable inducible non-fusion *E. coli* expression vectors include pTrc

15   (Amrann *et al.*, (1988) *Gene* 69:301-315) and pET 11d (Studier *et al.*, GENE EXPRESSION TECHNOLOGY: METHODS IN ENZYMOLOGY 185, Academic Press, San Diego, Calif. (1990) 60-89).

One strategy to maximize recombinant protein expression in *E. coli* is to express the protein in a host bacteria with an impaired capacity to proteolytically cleave the recombinant

20   protein. *See, e.g.,* Gottesman, GENE EXPRESSION TECHNOLOGY: METHODS IN ENZYMOLOGY 185, Academic Press, San Diego, Calif. (1990) 119-128. Another strategy is to alter the nucleic acid sequence of the nucleic acid to be inserted into an expression vector so that the individual codons for each amino acid are those preferentially utilized in *E. coli* (*see, e.g.,* Wada, *et al.*, 1992. *Nucl. Acids Res.* 20: 2111-2118). Such alteration of nucleic acid

25   sequences of the invention can be carried out by standard DNA synthesis techniques.

In another embodiment, the NOVX expression vector is a yeast expression vector. Examples of vectors for expression in yeast *Saccharomyces cerivisae* include pYepSec1 (Baldari, *et al.*, 1987. *EMBO J.* 6: 229-234), pMFa (Kurjan and Herskowitz, 1982. *Cell* 30: 933-943), pJRY88 (Schultz *et al.*, 1987. *Gene* 54: 113-123), pYES2 (Invitrogen Corporation,

30   San Diego, Calif.), and picZ (InVitrogen Corp, San Diego, Calif.).

Alternatively, NOVX can be expressed in insect cells using baculovirus expression vectors. Baculovirus vectors available for expression of proteins in cultured insect cells (*e.g.,* SF9 cells) include the pAc series (Smith, *et al.*, 1983. *Mol. Cell. Biol.* 3: 2156-2165) and the pVL series (Lucklow and Summers, 1989. *Virology* 170: 31-39).

In yet another embodiment, a nucleic acid of the invention is expressed in mammalian cells using a mammalian expression vector. Examples of mammalian expression vectors include pCDM8 (Seed, 1987. *Nature* 329: 840) and pMT2PC (Kaufman, *et al.*, 1987. *EMBO J.* 6: 187-195). When used in mammalian cells, the expression vector's control functions are

5   often provided by viral regulatory elements. For example, commonly used promoters are derived from polyoma, adenovirus 2, cytomegalovirus, and simian virus 40. For other suitable expression systems for both prokaryotic and eukaryotic cells see, *e.g.*, Chapters 16 and 17 of Sambrook, *et al.*, MOLECULAR CLONING: A LABORATORY MANUAL. 2nd ed., Cold Spring Harbor Laboratory, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y.,

10   1989.

In another embodiment, the recombinant mammalian expression vector is capable of directing expression of the nucleic acid preferentially in a particular cell type (*e.g.*, tissue-specific regulatory elements are used to express the nucleic acid). Tissue-specific regulatory elements are known in the art. Non-limiting examples of suitable tissue-specific

15   promoters include the albumin promoter (liver-specific; Pinkert, *et al.*, 1987. *Genes Dev.* 1: 268-277), lymphoid-specific promoters (Calame and Eaton, 1988. *Adv. Immunol.* 43: 235-275), in particular promoters of T cell receptors (Winoto and Baltimore, 1989. *EMBO J.* 8: 729-733) and immunoglobulins (Banerji, *et al.*, 1983. *Cell* 33: 729-740; Queen and Baltimore, 1983. *Cell* 33: 741-748), neuron-specific promoters (*e.g.*, the neurofilament

20   promoter; Byrne and Ruddle, 1989. *Proc. Natl. Acad. Sci. USA* 86: 5473-5477), pancreas-specific promoters (Edlund, *et al.*, 1985. *Science* 230: 912-916), and mammary gland-specific promoters (*e.g.*, milk whey promoter; U.S. Pat. No. 4,873,316 and European Application Publication No. 264,166). Developmentally-regulated promoters are also encompassed, *e.g.*, the murine hox promoters (Kessel and Gruss, 1990. *Science* 249:

25   374-379) and the α-fetoprotein promoter (Campes and Tilghman, 1989. *Genes Dev.* 3: 537-546).

The invention further provides a recombinant expression vector comprising a DNA molecule of the invention cloned into the expression vector in an antisense orientation. That is, the DNA molecule is operatively-linked to a regulatory sequence in a manner that allows

30   for expression (by transcription of the DNA molecule) of an RNA molecule that is antisense to NOVX mRNA. Regulatory sequences operatively linked to a nucleic acid cloned in the antisense orientation can be chosen that direct the continuous expression of the antisense RNA molecule in a variety of cell types, for instance viral promoters and/or enhancers, or regulatory sequences can be chosen that direct constitutive, tissue specific or cell type

specific expression of antisense RNA. The antisense expression vector can be in the form of a recombinant plasmid, phagemid or attenuated virus in which antisense nucleic acids are produced under the control of a high efficiency regulatory region, the activity of which can be determined by the cell type into which the vector is introduced. For a discussion of the

5 regulation of gene expression using antisense genes *see, e.g.,* Weintraub, *et al.*, "Antisense RNA as a molecular tool for genetic analysis," *Reviews-Trends in Genetics,* Vol. 1(1) 1986.

Another aspect of the invention pertains to host cells into which a recombinant expression vector of the invention has been introduced. The terms "host cell" and "recombinant host cell" are used interchangeably herein. It is understood that such terms

10 refer not only to the particular subject cell but also to the progeny or potential progeny of such a cell. Because certain modifications may occur in succeeding generations due to either mutation or environmental influences, such progeny may not, in fact, be identical to the parent cell, but are still included within the scope of the term as used herein.

A host cell can be any prokaryotic or eukaryotic cell. For example, NOVX protein

15 can be expressed in bacterial cells such as *E. coli,* insect cells, yeast or mammalian cells (such as Chinese hamster ovary cells (CHO) or COS cells). Other suitable host cells are known to those skilled in the art.

Vector DNA can be introduced into prokaryotic or eukaryotic cells via conventional transformation or transfection techniques. As used herein, the terms "transformation" and

20 "transfection" are intended to refer to a variety of art-recognized techniques for introducing foreign nucleic acid (*e.g.,* DNA) into a host cell, including calcium phosphate or calcium chloride co-precipitation, DEAE-dextran-mediated transfection, lipofection, or electroporation. Suitable methods for transforming or transfecting host cells can be found in Sambrook, *et al.* (MOLECULAR CLONING: A LABORATORY MANUAL. 2nd ed., Cold Spring

25 Harbor Laboratory, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y., 1989), and other laboratory manuals.

For stable transfection of mammalian cells, it is known that, depending upon the expression vector and transfection technique used, only a small fraction of cells may integrate the foreign DNA into their genome. In order to identify and select these integrants, a gene

30 that encodes a selectable marker (*e.g.,* resistance to antibiotics) is generally introduced into the host cells along with the gene of interest. Various selectable markers include those that confer resistance to drugs, such as G418, hygromycin and methotrexate. Nucleic acid encoding a selectable marker can be introduced into a host cell on the same vector as that encoding NOVX or can be introduced on a separate vector. Cells stably transfected with the

introduced nucleic acid can be identified by drug selection (*e.g.*, cells that have incorporated the selectable marker gene will survive, while the other cells die).

A host cell of the invention, such as a prokaryotic or eukaryotic host cell in culture, can be used to produce (*i.e.*, express) NOVX protein. Accordingly, the invention further
5   provides methods for producing NOVX protein using the host cells of the invention. In one embodiment, the method comprises culturing the host cell of invention (into which a recombinant expression vector encoding NOVX protein has been introduced) in a suitable medium such that NOVX protein is produced. In another embodiment, the method further comprises isolating NOVX protein from the medium or the host cell.

10   **Transgenic NOVX Animals**

The host cells of the invention can also be used to produce non-human transgenic animals. For example, in one embodiment, a host cell of the invention is a fertilized oocyte or an embryonic stem cell into which NOVX protein-coding sequences have been introduced. Such host cells can then be used to create non-human transgenic animals in which exogenous
15   NOVX sequences have been introduced into their genome or homologous recombinant animals in which endogenous NOVX sequences have been altered. Such animals are useful for studying the function and/or activity of NOVX protein and for identifying and/or evaluating modulators of NOVX protein activity. As used herein, a "transgenic animal" is a non-human animal, preferably a mammal, more preferably a rodent such as a rat or mouse, in
20   which one or more of the cells of the animal includes a transgene. Other examples of transgenic animals include non-human primates, sheep, dogs, cows, goats, chickens, amphibians, *etc.* A transgene is exogenous DNA that is integrated into the genome of a cell from which a transgenic animal develops and that remains in the genome of the mature animal, thereby directing the expression of an encoded gene product in one or more cell types
25   or tissues of the transgenic animal. As used herein, a "homologous recombinant animal" is a non-human animal, preferably a mammal, more preferably a mouse, in which an endogenous NOVX gene has been altered by homologous recombination between the endogenous gene and an exogenous DNA molecule introduced into a cell of the animal, *e.g.*, an embryonic cell of the animal, prior to development of the animal.

30   A transgenic animal of the invention can be created by introducing NOVX-encoding nucleic acid into the male pronuclei of a fertilized oocyte (*e.g.*, by microinjection, retroviral infection) and allowing the oocyte to develop in a pseudopregnant female foster animal. The human NOVX cDNA sequences, *i.e.*, any one of SEQ ID NO:2n-1, wherein n is an integer

52

between 1-46, can be introduced as a transgene into the genome of a non-human animal. Alternatively, a non-human homologue of the human NOVX gene, such as a mouse NOVX gene, can be isolated based on hybridization to the human NOVX cDNA (described further *supra*) and used as a transgene. Intronic sequences and polyadenylation signals can also be

5   included in the transgene to increase the efficiency of expression of the transgene. A tissue-specific regulatory sequence(s) can be operably-linked to the NOVX transgene to direct expression of NOVX protein to particular cells. Methods for generating transgenic animals via embryo manipulation and microinjection, particularly animals such as mice, have become conventional in the art and are described, for example, in U.S. Patent Nos. 4,736,866;

10   4,870,009; and 4,873,191; and Hogan, 1986. In: MANIPULATING THE MOUSE EMBRYO, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y. Similar methods are used for production of other transgenic animals. A transgenic founder animal can be identified based upon the presence of the NOVX transgene in its genome and/or expression of NOVX mRNA in tissues or cells of the animals. A transgenic founder animal can then be used to breed

15   additional animals carrying the transgene. Moreover, transgenic animals carrying a transgene-encoding NOVX protein can further be bred to other transgenic animals carrying other transgenes.

To create a homologous recombinant animal, a vector is prepared which contains at least a portion of a NOVX gene into which a deletion, addition or substitution has been

20   introduced to thereby alter, *e.g.*, functionally disrupt, the NOVX gene. The NOVX gene can be a human gene (*e.g.*, the cDNA of any one of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46), but more preferably, is a non-human homologue of a human NOVX gene. For example, a mouse homologue of human NOVX gene of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, can be used to construct a homologous recombination vector

25   suitable for altering an endogenous NOVX gene in the mouse genome. In one embodiment, the vector is designed such that, upon homologous recombination, the endogenous NOVX gene is functionally disrupted (*i.e.*, no longer encodes a functional protein; also referred to as a "knock out" vector).

Alternatively, the vector can be designed such that, upon homologous recombination,

30   the endogenous NOVX gene is mutated or otherwise altered but still encodes functional protein (*e.g.*, the upstream regulatory region can be altered to thereby alter the expression of the endogenous NOVX protein). In the homologous recombination vector, the altered portion of the NOVX gene is flanked at its 5'- and 3'-termini by additional nucleic acid of the NOVX gene to allow for homologous recombination to occur between the exogenous NOVX

gene carried by the vector and an endogenous NOVX gene in an embryonic stem cell. The additional flanking NOVX nucleic acid is of sufficient length for successful homologous recombination with the endogenous gene. Typically, several kilobases of flanking DNA (both at the 5'- and 3'-termini) are included in the vector. *See, e.g.*, Thomas, *et al.*, 1987. *Cell*

5   51: 503 for a description of homologous recombination vectors. The vector is ten introduced into an embryonic stem cell line (*e.g.*, by electroporation) and cells in which the introduced NOVX gene has homologously-recombined with the endogenous NOVX gene are selected. *See, e.g.*, Li, *et al.*, 1992. *Cell* 69: 915.

       The selected cells are then injected into a blastocyst of an animal (*e.g.*, a mouse) to

10   form aggregation chimeras. *See, e.g.*, Bradley, 1987. In: TERATOCARCINOMAS AND EMBRYONIC STEM CELLS: A PRACTICAL APPROACH, Robertson, ed. IRL, Oxford, pp. 113-152. A chimeric embryo can then be implanted into a suitable pseudopregnant female foster animal and the embryo brought to term. Progeny harboring the homologously-recombined DNA in their germ cells can be used to breed animals in which all cells of the

15   animal contain the homologously-recombined DNA by germline transmission of the transgene. Methods for constructing homologous recombination vectors and homologous recombinant animals are described further in Bradley, 1991. *Curr. Opin. Biotechnol.* 2: 823-829; PCT International Publication Nos.: WO 90/11354; WO 91/01140; WO 92/0968; and WO 93/04169.

20   In another embodiment, transgenic non-humans animals can be produced that contain selected systems that allow for regulated expression of the transgene. One example of such a system is the cre/loxP recombinase system of bacteriophage P1. For a description of the cre/loxP recombinase system, *See, e.g.*, Lakso, *et al.*, 1992. *Proc. Natl. Acad. Sci. USA* 89: 6232-6236. Another example of a recombinase system is the FLP recombinase system of

25   *Saccharomyces cerevisiae. See,* O'Gorman, *et al.*, 1991. *Science* 251:1351-1355. If a cre/loxP recombinase system is used to regulate expression of the transgene, animals containing transgenes encoding both the Cre recombinase and a selected protein are required. Such animals can be provided through the construction of "double" transgenic animals, *e.g.*, by mating two transgenic animals, one containing a transgene encoding a selected protein and

30   the other containing a transgene encoding a recombinase.

       Clones of the non-human transgenic animals described herein can also be produced according to the methods described in Wilmut, *et al.*, 1997. *Nature* 385: 810-813. In brief, a cell (*e.g.*, a somatic cell) from the transgenic animal can be isolated and induced to exit the growth cycle and enter G_0 phase. The quiescent cell can then be fused, *e.g.*, through the use

of electrical pulses, to an enucleated oocyte from an animal of the same species from which the quiescent cell is isolated. The reconstructed oocyte is then cultured such that it develops to morula or blastocyte and then transferred to pseudopregnant female foster animal. The offspring borne of this female foster animal will be a clone of the animal from which the cell

5   (*e.g.*, the somatic cell) is isolated.

Pharmaceutical Compositions

The NOVX nucleic acid molecules, NOVX proteins, and anti-NOVX antibodies (also referred to herein as "active compounds") of the invention, and derivatives, fragments, analogs and homologs thereof, can be incorporated into pharmaceutical compositions suitable

10   for administration. Such compositions typically comprise the nucleic acid molecule, protein, or antibody and a pharmaceutically acceptable carrier. As used herein, "pharmaceutically acceptable carrier" is intended to include any and all solvents, dispersion media, coatings, antibacterial and antifungal agents, isotonic and absorption delaying agents, and the like, compatible with pharmaceutical administration. Suitable carriers are described in the most

15   recent edition of Remington's Pharmaceutical Sciences, a standard reference text in the field, which is incorporated herein by reference. Preferred examples of such carriers or diluents include, but are not limited to, water, saline, finger's solutions, dextrose solution, and 5% human serum albumin. Liposomes and non-aqueous vehicles such as fixed oils may also be used. The use of such media and agents for pharmaceutically active substances is well

20   known in the art. Except insofar as any conventional media or agent is incompatible with the active compound, use thereof in the compositions is contemplated. Supplementary active compounds can also be incorporated into the compositions.

A pharmaceutical composition of the invention is formulated to be compatible with its intended route of administration. Examples of routes of administration include parenteral,

25   *e.g.*, intravenous, intradermal, subcutaneous, oral (*e.g.*, inhalation), transdermal (*i.e.*, topical), transmucosal, and rectal administration. Solutions or suspensions used for parenteral, intradermal, or subcutaneous application can include the following components: a sterile diluent such as water for injection, saline solution, fixed oils, polyethylene glycols, glycerine, propylene glycol or other synthetic solvents; antibacterial agents such as benzyl alcohol or

30   methyl parabens; antioxidants such as ascorbic acid or sodium bisulfite; chelating agents such as ethylenediaminetetraacetic acid (EDTA); buffers such as acetates, citrates or phosphates, and agents for the adjustment of tonicity such as sodium chloride or dextrose. The pH can be adjusted with acids or bases, such as hydrochloric acid or sodium hydroxide. The parenteral

preparation can be enclosed in ampoules, disposable syringes or multiple dose vials made of glass or plastic.

Pharmaceutical compositions suitable for injectable use include sterile aqueous solutions (where water soluble) or dispersions and sterile powders for the extemporaneous

5   preparation of sterile injectable solutions or dispersion. For intravenous administration, suitable carriers include physiological saline, bacteriostatic water, Cremophor EL™ (BASF, Parsippany, N.J.) or phosphate buffered saline (PBS). In all cases, the composition must be sterile and should be fluid to the extent that easy syringeability exists. It must be stable under the conditions of manufacture and storage and must be preserved against the contaminating

10   action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (for example, glycerol, propylene glycol, and liquid polyethylene glycol, and the like), and suitable mixtures thereof. The proper fluidity can be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersion and by the use of

15   surfactants. Prevention of the action of microorganisms can be achieved by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, ascorbic acid, thimerosal, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars, polyalcohols such as manitol, sorbitol, sodium chloride in the composition. Prolonged absorption of the injectable compositions can be brought about by

20   including in the composition an agent which delays absorption, for example, aluminum monostearate and gelatin.

Sterile injectable solutions can be prepared by incorporating the active compound (e.g., a NOVX protein or anti-NOVX antibody) in the required amount in an appropriate solvent with one or a combination of ingredients enumerated above, as required, followed by

25   filtered sterilization. Generally, dispersions are prepared by incorporating the active compound into a sterile vehicle that contains a basic dispersion medium and the required other ingredients from those enumerated above. In the case of sterile powders for the preparation of sterile injectable solutions, methods of preparation are vacuum drying and freeze-drying that yields a powder of the active ingredient plus any additional desired

30   ingredient from a previously sterile-filtered solution thereof.

Oral compositions generally include an inert diluent or an edible carrier. They can be enclosed in gelatin capsules or compressed into tablets. For the purpose of oral therapeutic administration, the active compound can be incorporated with excipients and used in the form of tablets, troches, or capsules. Oral compositions can also be prepared using a fluid carrier

56

for use as a mouthwash, wherein the compound in the fluid carrier is applied orally and swished and expectorated or swallowed. Pharmaceutically compatible binding agents, and/or adjuvant materials can be included as part of the composition. The tablets, pills, capsules, troches and the like can contain any of the following ingredients, or compounds of a similar

5   nature: a binder such as microcrystalline cellulose, gum tragacanth or gelatin; an excipient such as starch or lactose, a disintegrating agent such as alginic acid, Primogel, or corn starch; a lubricant such as magnesium stearate or Sterotes; a glidant such as colloidal silicon dioxide; a sweetening agent such as sucrose or saccharin; or a flavoring agent such as peppermint, methyl salicylate, or orange flavoring.

10   For administration by inhalation, the compounds are delivered in the form of an aerosol spray from pressured container or dispenser which contains a suitable propellant, *e.g.*, a gas such as carbon dioxide, or a nebulizer.

Systemic administration can also be by transmucosal or transdermal means. For transmucosal or transdermal administration, penetrants appropriate to the barrier to be

15   permeated are used in the formulation. Such penetrants are generally known in the art, and include, for example, for transmucosal administration, detergents, bile salts, and fusidic acid derivatives. Transmucosal administration can be accomplished through the use of nasal sprays or suppositories. For transdermal administration, the active compounds are formulated into ointments, salves, gels, or creams as generally known in the art.

20   The compounds can also be prepared in the form of suppositories (*e.g.*, with conventional suppository bases such as cocoa butter and other glycerides) or retention enemas for rectal delivery.

In one embodiment, the active compounds are prepared with carriers that will protect the compound against rapid elimination from the body, such as a controlled release

25   formulation, including implants and microencapsulated delivery systems. Biodegradable, biocompatible polymers can be used, such as ethylene vinyl acetate, polyanhydrides, polyglycolic acid, collagen, polyorthoesters, and polylactic acid. Methods for preparation of such formulations will be apparent to those skilled in the art. The materials can also be obtained commercially from Alza Corporation and Nova Pharmaceuticals, Inc. Liposomal

30   suspensions (including liposomes targeted to infected cells with monoclonal antibodies to viral antigens) can also be used as pharmaceutically acceptable carriers. These can be prepared according to methods known to those skilled in the art, for example, as described in U.S. Patent No. 4,522,811.

It is especially advantageous to formulate oral or parenteral compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used herein refers to physically discrete units suited as unitary dosages for the subject to be treated; each unit containing a predetermined quantity of active compound calculated to

5   produce the desired therapeutic effect in association with the required pharmaceutical carrier. The specification for the dosage unit forms of the invention are dictated by and directly dependent on the unique characteristics of the active compound and the particular therapeutic effect to be achieved, and the limitations inherent in the art of compounding such an active compound for the treatment of individuals.

10   The nucleic acid molecules of the invention can be inserted into vectors and used as gene therapy vectors. Gene therapy vectors can be delivered to a subject by, for example, intravenous injection, local administration (*see, e.g.,* U.S. Patent No. 5,328,470) or by stereotactic injection (*see, e.g.,* Chen, *et al.,* 1994. *Proc. Natl. Acad. Sci. USA* 91: 3054-3057). The pharmaceutical preparation of the gene therapy vector can include the gene

15   therapy vector in an acceptable diluent, or can comprise a slow release matrix in which the gene delivery vehicle is imbedded. Alternatively, where the complete gene delivery vector can be produced intact from recombinant cells, *e.g.,* retroviral vectors, the pharmaceutical preparation can include one or more cells that produce the gene delivery system.

The pharmaceutical compositions can be included in a container, pack, or dispenser

20   together with instructions for administration.

Screening and Detection Methods

The isolated nucleic acid molecules of the invention can be used to express NOVX protein (*e.g.,* via a recombinant expression vector in a host cell in gene therapy applications), to detect NOVX mRNA (*e.g.,* in a biological sample) or a genetic lesion in a NOVX gene,

25   and to modulate NOVX activity, as described further, below. In addition, the NOVX proteins can be used to screen drugs or compounds that modulate the NOVX protein activity or expression as well as to treat disorders characterized by insufficient or excessive production of NOVX protein or production of NOVX protein forms that have decreased or aberrant activity compared to NOVX wild-type protein (*e.g.;* diabetes (regulates insulin release);

30   obesity (binds and transport lipids); metabolic disturbances associated with obesity, the metabolic syndrome X as well as anorexia and wasting disorders associated with chronic diseases and various cancers, and infectious disease(possesses anti-microbial activity) and the various dyslipidemias. In addition, the anti-NOVX antibodies of the invention can be used to

58

detect and isolate NOVX proteins and modulate NOVX activity. In yet a further aspect, the invention can be used in methods to influence appetite, absorption of nutrients and the disposition of metabolic substrates in both a positive and negative fashion.

The invention further pertains to novel agents identified by the screening assays
5   described herein and uses thereof for treatments as described, *supra*.

Screening Assays

The invention provides a method (also referred to herein as a "screening assay") for identifying modulators, *i.e.*, candidate or test compounds or agents (*e.g.*, peptides,
10   peptidomimetics, small molecules or other drugs) that bind to NOVX proteins or have a stimulatory or inhibitory effect on, *e.g.*, NOVX protein expression or NOVX protein activity. The invention also includes compounds identified in the screening assays described herein.

In one embodiment, the invention provides assays for screening candidate or test compounds which bind to or modulate the activity of the membrane-bound form of a NOVX
15   protein or polypeptide or biologically-active portion thereof. The test compounds of the invention can be obtained using any of the numerous approaches in combinatorial library methods known in the art, including: biological libraries; spatially addressable parallel solid phase or solution phase libraries; synthetic library methods requiring deconvolution; the "one-bead one-compound" library method; and synthetic library methods using affinity
20   chromatography selection. The biological library approach is limited to peptide libraries, while the other four approaches are applicable to peptide, non-peptide oligomer or small molecule libraries of compounds. *See, e.g.*, Lam, 1997. *Anticancer Drug Design* 12: 145.

A "small molecule" as used herein, is meant to refer to a composition that has a molecular weight of less than about 5 kD and most preferably less than about 4 kD. Small
25   molecules can be, *e.g.*, nucleic acids, peptides, polypeptides, peptidomimetics, carbohydrates, lipids or other organic or inorganic molecules. Libraries of chemical and/or biological mixtures, such as fungal, bacterial, or algal extracts, are known in the art and can be screened with any of the assays of the invention.

Examples of methods for the synthesis of molecular libraries can be found in the art,
30   for example in: DeWitt, *et al.*, 1993. *Proc. Natl. Acad. Sci. U.S.A.* 90: 6909; Erb, *et al.*, 1994. *Proc. Natl. Acad. Sci. U.S.A.* 91: 11422; Zuckermann, *et al.*, 1994. *J. Med. Chem.* 37: 2678; Cho, *et al.*, 1993. *Science* 261: 1303; Carrell, *et al.*, 1994. *Angew. Chem. Int. Ed. Engl.* 33: 2059; Carell, *et al.*, 1994. *Angew. Chem. Int. Ed. Engl.* 33: 2061; and Gallop, *et al.*, 1994. *J. Med. Chem.* 37: 1233.

Libraries of compounds may be presented in solution (*e.g.*, Houghten, 1992.

Biotechniques 13: 412-421), or on beads (Lam, 1991. *Nature* 354: 82-84), on chips (Fodor,

1993. *Nature* 364: 555-556), bacteria (Ladner, U.S. Patent No. 5,223,409), spores (Ladner,

U.S. Patent 5,233,409), plasmids (Cull, *et al.*, 1992. *Proc. Natl. Acad. Sci. USA* 89:

5   1865-1869) or on phage (Scott and Smith, 1990. *Science* 249: 386-390; Devlin, 1990. *Science*

249: 404-406; Cwirla, *et al.*, 1990. *Proc. Natl. Acad. Sci. U.S.A.* 87: 6378-6382; Felici, 1991.

J. Mol. Biol. 222: 301-310; Ladner, U.S. Patent No. 5,233,409.).

In one embodiment, an assay is a cell-based assay in which a cell which expresses a

membrane-bound form of NOVX protein, or a biologically-active portion thereof, on the cell

10   surface is contacted with a test compound and the ability of the test compound to bind to a

NOVX protein determined. The cell, for example, can of mammalian origin or a yeast cell.

Determining the ability of the test compound to bind to the NOVX protein can be

accomplished, for example, by coupling the test compound with a radioisotope or enzymatic

label such that binding of the test compound to the NOVX protein or biologically-active

15   portion thereof can be determined by detecting the labeled compound in a complex. For

example, test compounds can be labeled with ^{125}I, ^{35}S, ^{14}C, or ^{3}H, either directly or indirectly,

and the radioisotope detected by direct counting of radioemission or by scintillation counting.

Alternatively, test compounds can be enzymatically-labeled with, for example, horseradish

peroxidase, alkaline phosphatase, or luciferase, and the enzymatic label detected by

20   determination of conversion of an appropriate substrate to product. In one embodiment, the

assay comprises contacting a cell which expresses a membrane-bound form of NOVX

protein, or a biologically-active portion thereof, on the cell surface with a known compound

which binds NOVX to form an assay mixture, contacting the assay mixture with a test

compound, and determining the ability of the test compound to interact with a NOVX

25   protein, wherein determining the ability of the test compound to interact with a NOVX

protein comprises determining the ability of the test compound to preferentially bind to

NOVX protein or a biologically-active portion thereof as compared to the known compound.

In another embodiment, an assay is a cell-based assay comprising contacting a cell

expressing a membrane-bound form of NOVX protein, or a biologically-active portion

30   thereof, on the cell surface with a test compound and determining the ability of the test

compound to modulate (*e.g.*, stimulate or inhibit) the activity of the NOVX protein or

biologically-active portion thereof. Determining the ability of the test compound to modulate

the activity of NOVX or a biologically-active portion thereof can be accomplished, for

example, by determining the ability of the NOVX protein to bind to or interact with a NOVX

60

target molecule. As used herein, a "target molecule" is a molecule with which a NOVX protein binds or interacts in nature, for example, a molecule on the surface of a cell which expresses a NOVX interacting protein, a molecule on the surface of a second cell, a molecule in the extracellular milieu, a molecule associated with the internal surface of a cell membrane

5   or a cytoplasmic molecule. A NOVX target molecule can be a non-NOVX molecule or a NOVX protein or polypeptide of the invention. In one embodiment, a NOVX target molecule is a component of a signal transduction pathway that facilitates transduction of an extracellular signal (*e.g.* a signal generated by binding of a compound to a membrane-bound NOVX molecule) through the cell membrane and into the cell. The target, for example, can

10 be a second intercellular protein that has catalytic activity or a protein that facilitates the association of downstream signaling molecules with NOVX.

Determining the ability of the NOVX protein to bind to or interact with a NOVX target molecule can be accomplished by one of the methods described above for determining direct binding. In one embodiment, determining the ability of the NOVX protein to bind to or

15 interact with a NOVX target molecule can be accomplished by determining the activity of the target molecule. For example, the activity of the target molecule can be determined by detecting induction of a cellular second messenger of the target (*i.e.* intracellular Ca^{2+}, diacylglycerol, IP_3, *etc.*), detecting catalytic/enzymatic activity of the target an appropriate substrate, detecting the induction of a reporter gene (comprising a NOVX-responsive

20 regulatory element operatively linked to a nucleic acid encoding a detectable marker, *e.g.*, luciferase), or detecting a cellular response, for example, cell survival, cellular differentiation, or cell proliferation.

In yet another embodiment, an assay of the invention is a cell-free assay comprising contacting a NOVX protein or biologically-active portion thereof with a test compound and

25 determining the ability of the test compound to bind to the NOVX protein or biologically-active portion thereof. Binding of the test compound to the NOVX protein can be determined either directly or indirectly as described above. In one such embodiment, the assay comprises contacting the NOVX protein or biologically-active portion thereof with a known compound which binds NOVX to form an assay mixture, contacting the assay mixture with a test

30 compound, and determining the ability of the test compound to interact with a NOVX protein, wherein determining the ability of the test compound to interact with a NOVX protein comprises determining the ability of the test compound to preferentially bind to NOVX or biologically-active portion thereof as compared to the known compound.

61

In still another embodiment, an assay is a cell-free assay comprising contacting NOVX protein or biologically-active portion thereof with a test compound and determining the ability of the test compound to modulate (e.g. stimulate or inhibit) the activity of the NOVX protein or biologically-active portion thereof. Determining the ability of the test

5   compound to modulate the activity of NOVX can be accomplished, for example, by determining the ability of the NOVX protein to bind to a NOVX target molecule by one of the methods described above for determining direct binding. In an alternative embodiment, determining the ability of the test compound to modulate the activity of NOVX protein can be accomplished by determining the ability of the NOVX protein further modulate a NOVX

10   target molecule. For example, the catalytic/enzymatic activity of the target molecule on an appropriate substrate can be determined as described, *supra.*

In yet another embodiment, the cell-free assay comprises contacting the NOVX protein or biologically-active portion thereof with a known compound which binds NOVX protein to form an assay mixture, contacting the assay mixture with a test compound, and

15   determining the ability of the test compound to interact with a NOVX protein, wherein determining the ability of the test compound to interact with a NOVX protein comprises determining the ability of the NOVX protein to preferentially bind to or modulate the activity of a NOVX target molecule.

The cell-free assays of the invention are amenable to use of both the soluble form or

20   the membrane-bound form of NOVX protein. In the case of cell-free assays comprising the membrane-bound form of NOVX protein, it may be desirable to utilize a solubilizing agent such that the membrane-bound form of NOVX protein is maintained in solution. Examples of such solubilizing agents include non-ionic detergents such as n-octylglucoside, n-dodecylglucoside, n-dodecylmaltoside, octanoyl-N-methylglucamide,

25   decanoyl-N-methylglucamide, Triton® X-100, Triton® X-114, Thesit®, Isotridecypoly(ethylene glycol ether)$_n$, N-dodecyl--N,N-dimethyl-3-ammonio-1-propane sulfonate, 3-(3-cholamidopropyl) dimethylamminiol-1-propane sulfonate (CHAPS), or 3-(3-cholamidopropyl)dimethylamminiol-2-hydroxy-1-propane sulfonate (CHAPSO).

In more than one embodiment of the above assay methods of the invention, it may be

30   desirable to immobilize either NOVX protein or its target molecule to facilitate separation of complexed from uncomplexed forms of one or both of the proteins, as well as to accommodate automation of the assay. Binding of a test compound to NOVX protein, or interaction of NOVX protein with a target molecule in the presence and absence of a candidate compound, can be accomplished in any vessel suitable for containing the reactants.

Examples of such vessels include microtiter plates, test tubes, and micro-centrifuge tubes. In one embodiment, a fusion protein can be provided that adds a domain that allows one or both of the proteins to be bound to a matrix. For example, GST-NOVX fusion proteins or GST-target fusion proteins can be adsorbed onto glutathione sepharose beads (Sigma Chemical, St.

5   Louis, MO) or glutathione derivatized microtiter plates, that are then combined with the test compound or the test compound and either the non-adsorbed target protein or NOVX protein, and the mixture is incubated under conditions conducive to complex formation (e.g., at physiological conditions for salt and pH). Following incubation, the beads or microtiter plate wells are washed to remove any unbound components, the matrix immobilized in the case of

10   beads, complex determined either directly or indirectly, for example, as described, *supra*. Alternatively, the complexes can be dissociated from the matrix, and the level of NOVX protein binding or activity determined using standard techniques.

Other techniques for immobilizing proteins on matrices can also be used in the screening assays of the invention. For example, either the NOVX protein or its target

15   molecule can be immobilized utilizing conjugation of biotin and streptavidin. Biotinylated NOVX protein or target molecules can be prepared from biotin-NHS (N-hydroxy-succinimide) using techniques well-known within the art (e.g., biotinylation kit, Pierce Chemicals, Rockford, Ill.), and immobilized in the wells of streptavidin-coated 96 well plates (Pierce Chemical). Alternatively, antibodies reactive with NOVX protein or target

20   molecules, but which do not interfere with binding of the NOVX protein to its target molecule, can be derivatized to the wells of the plate, and unbound target or NOVX protein trapped in the wells by antibody conjugation. Methods for detecting such complexes, in addition to those described above for the GST-immobilized complexes, include immunodetection of complexes using antibodies reactive with the NOVX protein or target

25   molecule, as well as enzyme-linked assays that rely on detecting an enzymatic activity associated with the NOVX protein or target molecule.

In another embodiment, modulators of NOVX protein expression are identified in a method wherein a cell is contacted with a candidate compound and the expression of NOVX mRNA or protein in the cell is determined. The level of expression of NOVX mRNA or

30   protein in the presence of the candidate compound is compared to the level of expression of NOVX mRNA or protein in the absence of the candidate compound. The candidate compound can then be identified as a modulator of NOVX mRNA or protein expression based upon this comparison. For example, when expression of NOVX mRNA or protein is greater (*i.e.*, statistically significantly greater) in the presence of the candidate compound than

63

in its absence, the candidate compound is identified as a stimulator of NOVX mRNA or protein expression. Alternatively, when expression of NOVX mRNA or protein is less (statistically significantly less) in the presence of the candidate compound than in its absence, the candidate compound is identified as an inhibitor of NOVX mRNA or protein expression.

5   The level of NOVX mRNA or protein expression in the cells can be determined by methods described herein for detecting NOVX mRNA or protein.

In yet another aspect of the invention, the NOVX proteins can be used as "bait proteins" in a two-hybrid assay or three hybrid assay (see, e.g., U.S. Patent No. 5,283,317; Zervos, et al., 1993. Cell 72: 223-232; Madura, et al., 1993. J. Biol. Chem. 268:

10   12046-12054; Bartel, et al., 1993. Biotechniques 14: 920-924; Iwabuchi, et al., 1993. Oncogene 8: 1693-1696; and Brent WO 94/10300), to identify other proteins that bind to or interact with NOVX ("NOVX-binding proteins" or "NOVX-bp") and modulate NOVX activity. Such NOVX-binding proteins are also involved in the propagation of signals by the NOVX proteins as, for example, upstream or downstream elements of the NOVX pathway.

15   The two-hybrid system is based on the modular nature of most transcription factors, which consist of separable DNA-binding and activation domains. Briefly, the assay utilizes two different DNA constructs. In one construct, the gene that codes for NOVX is fused to a gene encoding the DNA binding domain of a known transcription factor (e.g., GAL-4). In the other construct, a DNA sequence, from a library of DNA sequences, that encodes an

20   unidentified protein ("prey" or "sample") is fused to a gene that codes for the activation domain of the known transcription factor. If the "bait" and the "prey" proteins are able to interact, in vivo, forming a NOVX-dependent complex, the DNA-binding and activation domains of the transcription factor are brought into close proximity. This proximity allows transcription of a reporter gene (e.g., LacZ) that is operably linked to a transcriptional

25   regulatory site responsive to the transcription factor. Expression of the reporter gene can be detected and cell colonies containing the functional transcription factor can be isolated and used to obtain the cloned gene that encodes the protein which interacts with NOVX.

The invention further pertains to novel agents identified by the aforementioned screening assays and uses thereof for treatments as described herein.

30   **Detection Assays**

Portions or fragments of the cDNA sequences identified herein (and the corresponding complete gene sequences) can be used in numerous ways as polynucleotide reagents. By way of example, and not of limitation, these sequences can be used to: (i) map

64

their respective genes on a chromosome; and, thus, locate gene regions associated with genetic disease; (*ii*) identify an individual from a minute biological sample (tissue typing); and (*iii*) aid in forensic identification of a biological sample. Some of these applications are described in the subsections, below.

5

Chromosome Mapping

Once the sequence (or a portion of the sequence) of a gene has been isolated, this sequence can be used to map the location of the gene on a chromosome. This process is called chromosome mapping. Accordingly, portions or fragments of the NOVX sequences of

10   SEQ ID NO:2*n*-1, wherein *n* is an integer between 1-46, or fragments or derivatives thereof, can be used to map the location of the NOVX genes, respectively, on a chromosome. The mapping of the NOVX sequences to chromosomes is an important first step in correlating these sequences with genes associated with disease.

Briefly, NOVX genes can be mapped to chromosomes by preparing PCR primers

15   (preferably 15-25 bp in length) from the NOVX sequences. Computer analysis of the NOVX, sequences can be used to rapidly select primers that do not span more than one exon in the genomic DNA, thus complicating the amplification process. These primers can then be used for PCR screening of somatic cell hybrids containing individual human chromosomes. Only those hybrids containing the human gene corresponding to the NOVX sequences will

20   yield an amplified fragment.

Somatic cell hybrids are prepared by fusing somatic cells from different mammals (*e.g.*, human and mouse cells). As hybrids of human and mouse cells grow and divide, they gradually lose human chromosomes in random order, but retain the mouse chromosomes. By using media in which mouse cells cannot grow, because they lack a particular enzyme, but in

25   which human cells can, the one human chromosome that contains the gene encoding the needed enzyme will be retained. By using various media, panels of hybrid cell lines can be established. Each cell line in a panel contains either a single human chromosome or a small number of human chromosomes, and a full set of mouse chromosomes, allowing easy mapping of individual genes to specific human chromosomes. *See, e.g.,* D'Eustachio, *et al.,*

30   1983. *Science* 220: 919-924. Somatic cell hybrids containing only fragments of human chromosomes can also be produced by using human chromosomes with translocations and deletions.

PCR mapping of somatic cell hybrids is a rapid procedure for assigning a particular sequence to a particular chromosome. Three or more sequences can be assigned per day

65

using a single thermal cycler. Using the NOVX sequences to design oligonucleotide primers,

sub-localization can be achieved with panels of fragments from specific chromosomes.

Fluorescence *in situ* hybridization (FISH) of a DNA sequence to a metaphase

chromosomal spread can further be used to provide a precise chromosomal location in one

5   step. Chromosome spreads can be made using cells whose division has been blocked in

metaphase by a chemical like colcemid that disrupts the mitotic spindle. The chromosomes

can be treated briefly with trypsin, and then stained with Giemsa. A pattern of light and dark

bands develops on each chromosome, so that the chromosomes can be identified individually.

The FISH technique can be used with a DNA sequence as short as 500 or 600 bases.

10   However, clones larger than 1,000 bases have a higher likelihood of binding to a unique

chromosomal location with sufficient signal intensity for simple detection. Preferably 1,000

bases, and more preferably 2,000 bases, will suffice to get good results at a reasonable

amount of time. For a review of this technique, *see,* Verma, *et al.,* HUMAN CHROMOSOMES:

A MANUAL OF BASIC TECHNIQUES (Pergamon Press, New York 1988).

15   Reagents for chromosome mapping can be used individually to mark a single

chromosome or a single site on that chromosome, or panels of reagents can be used for

marking multiple sites and/or multiple chromosomes. Reagents corresponding to noncoding

regions of the genes actually are preferred for mapping purposes. Coding sequences are more

likely to be conserved within gene families, thus increasing the chance of cross hybridizations

20   during chromosomal mapping.

Once a sequence has been mapped to a precise chromosomal location, the physical

position of the sequence on the chromosome can be correlated with genetic map data. Such

data are found, *e.g.,* in McKusick, MENDELIAN INHERITANCE IN MAN, available on-line

through Johns Hopkins University Welch Medical Library). The relationship between genes

25   and disease, mapped to the same chromosomal region, can then be identified through linkage

analysis (co-inheritance of physically adjacent genes), described in, *e.g.,* Egeland, *et al.,*

1987. *Nature,* 325: 783-787.

Moreover, differences in the DNA sequences between individuals affected and

unaffected with a disease associated with the NOVX gene, can be determined. If a mutation

30   is observed in some or all of the affected individuals but not in any unaffected individuals,

then the mutation is likely to be the causative agent of the particular disease. Comparison of

affected and unaffected individuals generally involves first looking for structural alterations

in the chromosomes, such as deletions or translocations that are visible from chromosome

spreads or detectable using PCR based on that DNA sequence. Ultimately, complete

66

sequencing of genes from several individuals can be performed to confirm the presence of a mutation and to distinguish mutations from polymorphisms.

Tissue Typing

5   The NOVX sequences of the invention can also be used to identify individuals from minute biological samples. In this technique, an individual's genomic DNA is digested with one or more restriction enzymes, and probed on a Southern blot to yield unique bands for identification. The sequences of the invention are useful as additional DNA markers for RFLP ("restriction fragment length polymorphisms," described in U.S. Patent No.

10   5,272,057).

Furthermore, the sequences of the invention can be used to provide an alternative technique that determines the actual base-by-base DNA sequence of selected portions of an individual's genome. Thus, the NOVX sequences described herein can be used to prepare two PCR primers from the 5'- and 3'-termini of the sequences. These primers can then be

15   used to amplify an individual's DNA and subsequently sequence it.

Panels of corresponding DNA sequences from individuals, prepared in this manner, can provide unique individual identifications, as each individual will have a unique set of such DNA sequences due to allelic differences. The sequences of the invention can be used to obtain such identification sequences from individuals and from tissue. The NOVX

20   sequences of the invention uniquely represent portions of the human genome. Allelic variation occurs to some degree in the coding regions of these sequences, and to a greater degree in the noncoding regions. It is estimated that allelic variation between individual humans occurs with a frequency of about once per each 500 bases. Much of the allelic variation is due to single nucleotide polymorphisms (SNPs), which include restriction

25   fragment length polymorphisms (RFLPs).

Each of the sequences described herein can, to some degree, be used as a standard against which DNA from an individual can be compared for identification purposes. Because greater numbers of polymorphisms occur in the noncoding regions, fewer sequences are necessary to differentiate individuals. The noncoding sequences can comfortably provide

30   positive individual identification with a panel of perhaps 10 to 1,000 primers that each yield a noncoding amplified sequence of 100 bases. If coding sequences, such as those of SEQ ID NO:2n-1, wherein n is an integer between 1-46, are used, a more appropriate number of primers for positive individual identification would be 500-2,000.

Predictive Medicine

The invention also pertains to the field of predictive medicine in which diagnostic assays, prognostic assays, pharmacogenomics, and monitoring clinical trials are used for

5   prognostic (predictive) purposes to thereby treat an individual prophylactically. Accordingly, one aspect of the invention relates to diagnostic assays for determining NOVX protein and/or nucleic acid expression as well as NOVX activity, in the context of a biological sample (*e.g.*, blood, serum, cells, tissue) to thereby determine whether an individual is afflicted with a disease or disorder, or is at risk of developing a disorder, associated with aberrant NOVX

10   expression or activity. The disorders include metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, and hematopoietic disorders, and the various dyslipidemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. The

15   invention also provides for prognostic (or predictive) assays for determining whether an individual is at risk of developing a disorder associated with NOVX protein, nucleic acid expression or activity. For example, mutations in a NOVX gene can be assayed in a biological sample. Such assays can be used for prognostic or predictive purpose to thereby prophylactically treat an individual prior to the onset of a disorder characterized by or

20   associated with NOVX protein, nucleic acid expression, or biological activity.

Another aspect of the invention provides methods for determining NOVX protein, nucleic acid expression or activity in an individual to thereby select appropriate therapeutic or prophylactic agents for that individual (referred to herein as "pharmacogenomics"). Pharmacogenomics allows for the selection of agents (*e.g.*, drugs) for therapeutic or

25   prophylactic treatment of an individual based on the genotype of the individual (*e.g.*, the genotype of the individual examined to determine the ability of the individual to respond to a particular agent.)

Yet another aspect of the invention pertains to monitoring the influence of agents (*e.g.*, drugs, compounds) on the expression or activity of NOVX in clinical trials.

30   These and other agents are described in further detail in the following sections.

Diagnostic Assays

An exemplary method for detecting the presence or absence of NOVX in a biological sample involves obtaining a biological sample from a test subject and contacting the

68

biological sample with a compound or an agent capable of detecting NOVX protein or nucleic acid (e.g., mRNA, genomic DNA) that encodes NOVX protein such that the presence of NOVX is detected in the biological sample. An agent for detecting NOVX mRNA or genomic DNA is a labeled nucleic acid probe capable of hybridizing to NOVX mRNA or

5   genomic DNA. The nucleic acid probe can be, for example, a full-length NOVX nucleic acid, such as the nucleic acid of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, or a portion thereof, such as an oligonucleotide of at least 15, 30, 50, 100, 250 or 500 nucleotides in length and sufficient to specifically hybridize under stringent conditions to NOVX mRNA or genomic DNA. Other suitable probes for use in the diagnostic assays of the invention are

10 described herein.

An agent for detecting NOVX protein is an antibody capable of binding to NOVX protein, preferably an antibody with a detectable label. Antibodies can be polyclonal, or more preferably, monoclonal. An intact antibody, or a fragment thereof (e.g., Fab or F(ab')$_2$) can be used. The term "labeled", with regard to the probe or antibody, is intended to

15 encompass direct labeling of the probe or antibody by coupling (i.e., physically linking) a detectable substance to the probe or antibody, as well as indirect labeling of the probe or antibody by reactivity with another reagent that is directly labeled. Examples of indirect labeling include detection of a primary antibody using a fluorescently-labeled secondary antibody and end-labeling of a DNA probe with biotin such that it can be detected with

20 fluorescently-labeled streptavidin. The term "biological sample" is intended to include tissues, cells and biological fluids isolated from a subject, as well as tissues, cells and fluids present within a subject. That is, the detection method of the invention can be used to detect NOVX mRNA, protein, or genomic DNA in a biological sample in vitro as well as in vivo. For example, in vitro techniques for detection of NOVX mRNA include Northern

25 hybridizations and in situ hybridizations. In vitro techniques for detection of NOVX protein include enzyme linked immunosorbent assays (ELISAs), Western blots, immunoprecipitations, and immunofluorescence. In vitro techniques for detection of NOVX genomic DNA include Southern hybridizations. Furthermore, in vivo techniques for detection of NOVX protein include introducing into a subject a labeled anti-NOVX antibody.

30 For example, the antibody can be labeled with a radioactive marker whose presence and location in a subject can be detected by standard imaging techniques.

In one embodiment, the biological sample contains protein molecules from the test subject. Alternatively, the biological sample can contain mRNA molecules from the test

69

subject or genomic DNA molecules from the test subject. A preferred biological sample is a peripheral blood leukocyte sample isolated by conventional means from a subject.

In another embodiment, the methods further involve obtaining a control biological sample from a control subject, contacting the control sample with a compound or agent
5   capable of detecting NOVX protein, mRNA, or genomic DNA, such that the presence of NOVX protein, mRNA or genomic DNA is detected in the biological sample, and comparing the presence of NOVX protein, mRNA or genomic DNA in the control sample with the presence of NOVX protein, mRNA or genomic DNA in the test sample.

The invention also encompasses kits for detecting the presence of NOVX in a
10   biological sample. For example, the kit can comprise: a labeled compound or agent capable of detecting NOVX protein or mRNA in a biological sample; means for determining the amount of NOVX in the sample; and means for comparing the amount of NOVX in the sample with a standard. The compound or agent can be packaged in a suitable container. The kit can further comprise instructions for using the kit to detect NOVX protein or nucleic
15   acid.

Prognostic Assays

The diagnostic methods described herein can furthermore be utilized to identify subjects having or at risk of developing a disease or disorder associated with aberrant NOVX
20   expression or activity. For example, the assays described herein, such as the preceding diagnostic assays or the following assays, can be utilized to identify a subject having or at risk of developing a disorder associated with NOVX protein, nucleic acid expression or activity. Alternatively, the prognostic assays can be utilized to identify a subject having or at risk for developing a disease or disorder. Thus, the invention provides a method for
25   identifying a disease or disorder associated with aberrant NOVX expression or activity in which a test sample is obtained from a subject and NOVX protein or nucleic acid (*e.g.*, mRNA, genomic DNA) is detected, wherein the presence of NOVX protein or nucleic acid is diagnostic for a subject having or at risk of developing a disease or disorder associated with aberrant NOVX expression or activity. As used herein, a "test sample" refers to a biological
30   sample obtained from a subject of interest. For example, a test sample can be a biological fluid (*e.g.*, serum), cell sample, or tissue.

Furthermore, the prognostic assays described herein can be used to determine whether a subject can be administered an agent (*e.g.*, an agonist, antagonist, peptidomimetic, protein, peptide, nucleic acid, small molecule, or other drug candidate) to treat a disease or disorder

70

associated with aberrant NOVX expression or activity. For example, such methods can be used to determine whether a subject can be effectively treated with an agent for a disorder. Thus, the invention provides methods for determining whether a subject can be effectively treated with an agent for a disorder associated with aberrant NOVX expression or activity in

5   which a test sample is obtained and NOVX protein or nucleic acid is detected (e.g., wherein the presence of NOVX protein or nucleic acid is diagnostic for a subject that can be administered the agent to treat a disorder associated with aberrant NOVX expression or activity).

The methods of the invention can also be used to detect genetic lesions in a NOVX

10   gene, thereby determining if a subject with the lesioned gene is at risk for a disorder characterized by aberrant cell proliferation and/or differentiation. In various embodiments, the methods include detecting, in a sample of cells from the subject, the presence or absence of a genetic lesion characterized by at least one of an alteration affecting the integrity of a gene encoding a NOVX-protein, or the misexpression of the NOVX gene. For example, such

15   genetic lesions can be detected by ascertaining the existence of at least one of: (*i*) a deletion of one or more nucleotides from a NOVX gene; (*ii*) an addition of one or more nucleotides to a NOVX gene; (*iii*) a substitution of one or more nucleotides of a NOVX gene, (*iv*) a chromosomal rearrangement of a NOVX gene; (*v*) an alteration in the level of a messenger RNA transcript of a NOVX gene, (*vi*) aberrant modification of a NOVX gene, such as of the

20   methylation pattern of the genomic DNA, (*vii*) the presence of a non-wild-type splicing pattern of a messenger RNA transcript of a NOVX gene, (*viii*) a non-wild-type level of a NOVX protein, (*ix*) allelic loss of a NOVX gene, and (*x*) inappropriate post-translational modification of a NOVX protein. As described herein, there are a large number of assay techniques known in the art which can be used for detecting lesions in a NOVX gene. A

25   preferred biological sample is a peripheral blood leukocyte sample isolated by conventional means from a subject. However, any biological sample containing nucleated cells may be used, including, for example, buccal mucosal cells.

In certain embodiments, detection of the lesion involves the use of a probe/primer in a polymerase chain reaction (PCR) (see, e.g., U.S. Patent Nos. 4,683,195 and 4,683,202), such

30   as anchor PCR or RACE PCR, or, alternatively, in a ligation chain reaction (LCR) (see, e.g., Landegran, et al., 1988. Science 241: 1077-1080; and Nakazawa, et al., 1994. Proc. Natl. Acad. Sci. USA 91: 360-364), the latter of which can be particularly useful for detecting point mutations in the NOVX-gene (see, Abravaya, et al., 1995. Nucl. Acids Res. 23: 675-682). This method can include the steps of collecting a sample of cells from a patient, isolating

71

nucleic acid (*e.g.*, genomic, mRNA or both) from the cells of the sample, contacting the nucleic acid sample with one or more primers that specifically hybridize to a NOVX gene under conditions such that hybridization and amplification of the NOVX gene (if present) occurs, and detecting the presence or absence of an amplification product, or detecting the

5   size of the amplification product and comparing the length to a control sample. It is anticipated that PCR and/or LCR may be desirable to use as a preliminary amplification step in conjunction with any of the techniques used for detecting mutations described herein.

Alternative amplification methods include: self sustained sequence replication (*see,* Guatelli, *et al.*, 1990. *Proc. Natl. Acad. Sci. USA* 87: 1874-1878), transcriptional

10   amplification system (*see,* Kwoh, *et al.*, 1989. *Proc. Natl. Acad. Sci. USA* 86: 1173-1177); Qβ Replicase (*see,* Lizardi, *et al,* 1988. *BioTechnology* 6: 1197), or any other nucleic acid amplification method, followed by the detection of the amplified molecules using techniques well known to those of skill in the art. These detection schemes are especially useful for the detection of nucleic acid molecules if such molecules are present in very low numbers.

15   In an alternative embodiment, mutations in a NOVX gene from a sample cell can be identified by alterations in restriction enzyme cleavage patterns. For example, sample and control DNA is isolated, amplified (optionally), digested with one or more restriction endonucleases, and fragment length sizes are determined by gel electrophoresis and compared. Differences in fragment length sizes between sample and control DNA indicates

20   mutations in the sample DNA. Moreover, the use of sequence specific ribozymes (*see, e.g.,* U.S. Patent No. 5,493,531) can be used to score for the presence of specific mutations by development or loss of a ribozyme cleavage site.

In other embodiments, genetic mutations in NOVX can be identified by hybridizing a sample and control nucleic acids, *e.g.*, DNA or RNA, to high-density arrays containing

25   hundreds or thousands of oligonucleotides probes. *See, e.g.,* Cronin, *et al.*, 1996. *Human Mutation* 7: 244-255; Kozal, *et al.*, 1996. *Nat. Med.* 2: 753-759. For example, genetic mutations in NOVX can be identified in two dimensional arrays containing light-generated DNA probes as described in Cronin, *et al., supra.* Briefly, a first hybridization array of probes can be used to scan through long stretches of DNA in a sample and control to identify

30   base changes between the sequences by making linear arrays of sequential overlapping probes. This step allows the identification of point mutations. This is followed by a second hybridization array that allows the characterization of specific mutations by using smaller, specialized probe arrays complementary to all variants or mutations detected. Each mutation

array is composed of parallel probe sets, one complementary to the wild-type gene and the other complementary to the mutant gene.

In yet another embodiment, any of a variety of sequencing reactions known in the art can be used to directly sequence the NOVX gene and detect mutations by comparing the
5   sequence of the sample NOVX with the corresponding wild-type (control) sequence. Examples of sequencing reactions include those based on techniques developed by Maxim and Gilbert, 1977. *Proc. Natl. Acad. Sci. USA* 74: 560 or Sanger, 1977. *Proc. Natl. Acad. Sci. USA* 74: 5463. It is also contemplated that any of a variety of automated sequencing procedures can be utilized when performing the diagnostic assays (*see, e.g.*, Naeve, *et al.*,
10   1995. *Biotechniques* 19: 448), including sequencing by mass spectrometry (see, *e.g.*, PCT International Publication No. WO 94/16101; Cohen, *et al.*, 1996. *Adv. Chromatography* 36: 127-162; and Griffin, *et al.*, 1993. *Appl. Biochem. Biotechnol.* 38: 147-159).

Other methods for detecting mutations in the NOVX gene include methods in which protection from cleavage agents is used to detect mismatched bases in RNA/RNA or
15   RNA/DNA heteroduplexes. *See, e.g.*, Myers, *et al.*, 1985. *Science* 230: 1242. In general, the art technique of "mismatch cleavage" starts by providing heteroduplexes of formed by hybridizing (labeled) RNA or DNA containing the wild-type NOVX sequence with potentially mutant RNA or DNA obtained from a tissue sample. The double-stranded duplexes are treated with an agent that cleaves single-stranded regions of the duplex such as
20   which will exist due to basepair mismatches between the control and sample strands. For instance, RNA/DNA duplexes can be treated with RNase and DNA/DNA hybrids treated with S$_1$ nuclease to enzymatically digesting the mismatched regions. In other embodiments, either DNA/DNA or RNA/DNA duplexes can be treated with hydroxylamine or osmium tetroxide and with piperidine in order to digest mismatched regions. After digestion of the
25   mismatched regions, the resulting material is then separated by size on denaturing polyacrylamide gels to determine the site of mutation. *See, e.g.*, Cotton, *et al.*, 1988. *Proc. Natl. Acad. Sci. USA* 85: 4397; Saleeba, *et al.*, 1992. *Methods Enzymol.* 217: 286-295. In an embodiment, the control DNA or RNA can be labeled for detection.

In still another embodiment, the mismatch cleavage reaction employs one or more
30   proteins that recognize mismatched base pairs in double-stranded DNA (so called "DNA mismatch repair" enzymes) in defined systems for detecting and mapping point mutations in NOVX cDNAs obtained from samples of cells. For example, the mutY enzyme of *E. coli* cleaves A at G/A mismatches and the thymidine DNA glycosylase from HeLa cells cleaves T at G/T mismatches. *See, e.g.*, Hsu, *et al.*, 1994. *Carcinogenesis* 15: 1657-1662. According to

73

an exemplary embodiment, a probe based on a NOVX sequence, e.g., a wild-type NOVX sequence, is hybridized to a cDNA or other DNA product from a test cell(s). The duplex is treated with a DNA mismatch repair enzyme, and the cleavage products, if any, can be detected from electrophoresis protocols or the like. See, e.g., U.S. Patent No. 5,459,039.

5   In other embodiments, alterations in electrophoretic mobility will be used to identify mutations in NOVX genes. For example, single strand conformation polymorphism (SSCP) may be used to detect differences in electrophoretic mobility between mutant and wild type nucleic acids. See, e.g., Orita, et al., 1989. Proc. Natl. Acad. Sci. USA: 86: 2766; Cotton, 1993. Mutat. Res. 285: 125-144; Hayashi, 1992. Genet. Anal. Tech. Appl. 9: 73-79.

10   Single-stranded DNA fragments of sample and control NOVX nucleic acids will be denatured and allowed to renature. The secondary structure of single-stranded nucleic acids varies according to sequence, the resulting alteration in electrophoretic mobility enables the detection of even a single base change. The DNA fragments may be labeled or detected with labeled probes. The sensitivity of the assay may be enhanced by using RNA (rather than

15   DNA), in which the secondary structure is more sensitive to a change in sequence. In one embodiment, the subject method utilizes heteroduplex analysis to separate double stranded heteroduplex molecules on the basis of changes in electrophoretic mobility. See, e.g., Keen, et al., 1991. Trends Genet. 7: 5.

In yet another embodiment, the movement of mutant or wild-type fragments in

20   polyacrylamide gels containing a gradient of denaturant is assayed using denaturing gradient gel electrophoresis (DGGE). See, e.g., Myers, et al., 1985. Nature 313: 495. When DGGE is used as the method of analysis, DNA will be modified to insure that it does not completely denature, for example by adding a GC clamp of approximately 40 bp of high-melting GC-rich DNA by PCR. In a further embodiment, a temperature gradient is used in place of a

25   denaturing gradient to identify differences in the mobility of control and sample DNA. See, e.g., Rosenbaum and Reissner, 1987. Biophys. Chem. 265: 12753.

Examples of other techniques for detecting point mutations include, but are not limited to, selective oligonucleotide hybridization, selective amplification, or selective primer extension. For example, oligonucleotide primers may be prepared in which the known

30   mutation is placed centrally and then hybridized to target DNA under conditions that permit hybridization only if a perfect match is found. See, e.g., Saiki, et al., 1986. Nature 324: 163; Saiki, et al., 1989. Proc. Natl. Acad. Sci. USA 86: 6230. Such allele specific oligonucleotides are hybridized to PCR amplified target DNA or a number of different mutations when the

oligonucleotides are attached to the hybridizing membrane and hybridized with labeled target DNA.

Alternatively, allele specific amplification technology that depends on selective PCR amplification may be used in conjunction with the instant invention. Oligonucleotides used as primers for specific amplification may carry the mutation of interest in the center of the molecule (so that amplification depends on differential hybridization; *see, e.g.,* Gibbs, *et al.,* 1989. *Nucl. Acids Res.* 17: 2437-2448) or at the extreme 3'-terminus of one primer where, under appropriate conditions, mismatch can prevent, or reduce polymerase extension (*see, e.g.,* Prossner, 1993. *Tibtech.* 11: 238). In addition it may be desirable to introduce a novel restriction site in the region of the mutation to create cleavage-based detection. *See, e.g.,* Gasparini, *et al.,* 1992. *Mol. Cell Probes* 6: 1. It is anticipated that in certain embodiments amplification may also be performed using *Taq* ligase for amplification. *See, e.g.,* Barany, 1991. *Proc. Natl. Acad. Sci. USA* 88: 189. In such cases, ligation will occur only if there is a perfect match at the 3'-terminus of the 5' sequence, making it possible to detect the presence of a known mutation at a specific site by looking for the presence or absence of amplification.

The methods described herein may be performed, for example, by utilizing pre-packaged diagnostic kits comprising at least one probe nucleic acid or antibody reagent described herein, which may be conveniently used, *e.g.,* in clinical settings to diagnose patients exhibiting symptoms or family history of a disease or illness involving a NOVX gene.

Furthermore, any cell type or tissue, preferably peripheral blood leukocytes, in which NOVX is expressed may be utilized in the prognostic assays described herein. However, any biological sample containing nucleated cells may be used, including, for example, buccal mucosal cells.

Pharmacogenomics

Agents, or modulators that have a stimulatory or inhibitory effect on NOVX activity (*e.g.,* NOVX gene expression), as identified by a screening assay described herein can be administered to individuals to treat (prophylactically or therapeutically) disorders (The disorders include metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, and hematopoietic disorders, and the various dyslipidemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers.) In conjunction with such

treatment, the pharmacogenomics (*i.e.*, the study of the relationship between an individual's genotype and that individual's response to a foreign compound or drug) of the individual may be considered. Differences in metabolism of therapeutics can lead to severe toxicity or therapeutic failure by altering the relation between dose and blood concentration of the

5   pharmacologically active drug. Thus, the pharmacogenomics of the individual permits the selection of effective agents (*e.g.*, drugs) for prophylactic or therapeutic treatments based on a consideration of the individual's genotype. Such pharmacogenomics can further be used to determine appropriate dosages and therapeutic regimens. Accordingly, the activity of NOVX protein, expression of NOVX nucleic acid, or mutation content of NOVX genes in an

10   individual can be determined to thereby select appropriate agent(s) for therapeutic or prophylactic treatment of the individual.

Pharmacogenomics deals with clinically significant hereditary variations in the response to drugs due to altered drug disposition and abnormal action in affected persons. See *e.g.*, Eichelbaum, 1996. *Clin. Exp. Pharmacol. Physiol.*, 23: 983-985; Linder, 1997. *Clin.*

15   *Chem.*, 43: 254-266. In general, two types of pharmacogenetic conditions can be differentiated. Genetic conditions transmitted as a single factor altering the way drugs act on the body (altered drug action) or genetic conditions transmitted as single factors altering the way the body acts on drugs (altered drug metabolism). These pharmacogenetic conditions can occur either as rare defects or as polymorphisms. For example, glucose-6-phosphate

20   dehydrogenase (G6PD) deficiency is a common inherited enzymopathy in which the main clinical complication is hemolysis after ingestion of oxidant drugs (anti-malarials, sulfonamides, analgesics, nitrofurans) and consumption of fava beans.

As an illustrative embodiment, the activity of drug metabolizing enzymes is a major determinant of both the intensity and duration of drug action. The discovery of genetic

25   polymorphisms of drug metabolizing enzymes (*e.g.*, N-acetyltransferase 2 (NAT 2) and cytochrome pregnancy zone protein precursor enzymes CYP2D6 and CYP2C19) has provided an explanation as to why some patients do not obtain the expected drug effects or show exaggerated drug response and serious toxicity after taking the standard and safe dose of a drug. These polymorphisms are expressed in two phenotypes in the population, the

30   extensive metabolizer (EM) and poor metabolizer (PM). The prevalence of PM is different among different populations. For example, the gene coding for CYP2D6 is highly polymorphic and several mutations have been identified in PM, which all lead to the absence of functional CYP2D6. Poor metabolizers of CYP2D6 and CYP2C19 quite frequently experience exaggerated drug response and side effects when they receive standard doses. If a

metabolite is the active therapeutic moiety, PM show no therapeutic response, as demonstrated for the analgesic effect of codeine mediated by its CYP2D6-formed metabolite morphine. At the other extreme are the so called ultra-rapid metabolizers who do not respond to standard doses. Recently, the molecular basis of ultra-rapid metabolism has been

5   identified to be due to CYP2D6 gene amplification.

Thus, the activity of NOVX protein, expression of NOVX nucleic acid, or mutation content of NOVX genes in an individual can be determined to thereby select appropriate agent(s) for therapeutic or prophylactic treatment of the individual. In addition, pharmacogenetic studies can be used to apply genotyping of polymorphic alleles encoding

10   drug-metabolizing enzymes to the identification of an individual's drug responsiveness phenotype. This knowledge, when applied to dosing or drug selection, can avoid adverse reactions or therapeutic failure and thus enhance therapeutic or prophylactic efficiency when treating a subject with a NOVX modulator, such as a modulator identified by one of the exemplary screening assays described herein.

15

Monitoring of Effects During Clinical Trials

Monitoring the influence of agents (*e.g.*, drugs, compounds) on the expression or activity of NOVX (*e.g.*, the ability to modulate aberrant cell proliferation and/or differentiation) can be applied not only in basic drug screening, but also in clinical trials. For

20   example, the effectiveness of an agent determined by a screening assay as described herein to increase NOVX gene expression, protein levels, or upregulate NOVX activity, can be monitored in clinical trails of subjects exhibiting decreased NOVX gene expression, protein levels, or downregulated NOVX activity. Alternatively, the effectiveness of an agent determined by a screening assay to decrease NOVX gene expression, protein levels, or

25   downregulate NOVX activity, can be monitored in clinical trails of subjects exhibiting increased NOVX gene expression, protein levels, or upregulated NOVX activity. In such clinical trials, the expression or activity of NOVX and, preferably, other genes that have been implicated in, for example, a cellular proliferation or immune disorder can be used as a "read out" or markers of the immune responsiveness of a particular cell.

30   By way of example, and not of limitation, genes, including NOVX, that are modulated in cells by treatment with an agent (*e.g.*, compound, drug or small molecule) that modulates NOVX activity (*e.g.*, identified in a screening assay as described herein) can be identified. Thus, to study the effect of agents on cellular proliferation disorders, for example, in a clinical trial, cells can be isolated and RNA prepared and analyzed for the levels of

77

expression of NOVX and other genes implicated in the disorder. The levels of gene

expression (*i.e.*, a gene expression pattern) can be quantified by Northern blot analysis or

RT-PCR, as described herein, or alternatively by measuring the amount of protein produced,

by one of the methods as described herein, or by measuring the levels of activity of NOVX or

5   other genes. In this manner, the gene expression pattern can serve as a marker, indicative of

the physiological response of the cells to the agent. Accordingly, this response state may be

determined before, and at various points during, treatment of the individual with the agent.

In one embodiment, the invention provides a method for monitoring the effectiveness

of treatment of a subject with an agent (*e.g.*, an agonist, antagonist, protein, peptide,

10   peptidomimetic, nucleic acid, small molecule, or other drug candidate identified by the

screening assays described herein) comprising the steps of (*i*) obtaining a pre-administration

sample from a subject prior to administration of the agent; (*ii*) detecting the level of

expression of a NOVX protein, mRNA, or genomic DNA in the preadministration sample;

(*iii*) obtaining one or more post-administration samples from the subject; (*iv*) detecting the

15   level of expression or activity of the NOVX protein, mRNA, or genomic DNA in the

post-administration samples; (*v*) comparing the level of expression or activity of the NOVX

protein, mRNA, or genomic DNA in the pre-administration sample with the NOVX protein,

mRNA, or genomic DNA in the post administration sample or samples; and (*vi*) altering the

administration of the agent to the subject accordingly. For example, increased administration

20   of the agent may be desirable to increase the expression or activity of NOVX to higher levels

than detected, *i.e.*, to increase the effectiveness of the agent. Alternatively, decreased

administration of the agent may be desirable to decrease expression or activity of NOVX to

lower levels than detected, *i.e.*, to decrease the effectiveness of the agent.

Methods of Treatment

25   The invention provides for both prophylactic and therapeutic methods of treating a

subject at risk of (or susceptible to) a disorder or having a disorder associated with aberrant

NOVX expression or activity. The disorders include cardiomyopathy, atherosclerosis,

hypertension, congenital heart defects, aortic stenosis, atrial septal defect (ASD),

atrioventricular (A-V) canal defect, ductus arteriosus, pulmonary stenosis, subaortic stenosis,

30   ventricular septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, obesity,

transplantation, adrenoleukodystrophy, congenital adrenal hyperplasia, prostate cancer,

neoplasm; adenocarcinoma, lymphoma, uterus cancer, fertility, hemophilia,

hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, graft versus

78

host disease, AIDS, bronchial asthma, Crohn's disease; multiple sclerosis, treatment of Albright Hereditary Ostoeodystrophy, and other diseases, disorders and conditions of the like. These methods of treatment will be discussed more fully, below.

5   **Disease and Disorders**

Diseases and disorders that are characterized by increased (relative to a subject not suffering from the disease or disorder) levels or biological activity may be treated with Therapeutics that antagonize (*i.e.*, reduce or inhibit) activity. Therapeutics that antagonize activity may be administered in a therapeutic or prophylactic manner. Therapeutics that may

10   be utilized include, but are not limited to: (*i*) an aforementioned peptide, or analogs, derivatives, fragments or homologs thereof; (*ii*) antibodies to an aforementioned peptide; (*iii*) nucleic acids encoding an aforementioned peptide; (*iv*) administration of antisense nucleic acid and nucleic acids that are "dysfunctional" (*i.e.*, due to a heterologous insertion within the coding sequences of coding sequences to an aforementioned peptide) that are utilized to

15   "knockout" endogenous function of an aforementioned peptide by homologous recombination (*see, e.g.*, Capecchi, 1989. *Science* 244: 1288-1292); or (*v*) modulators (*i.e.*, inhibitors, agonists and antagonists, including additional peptide mimetic of the invention or antibodies specific to a peptide of the invention) that alter the interaction between an aforementioned peptide and its binding partner.

20   Diseases and disorders that are characterized by decreased (relative to a subject not suffering from the disease or disorder) levels or biological activity may be treated with Therapeutics that increase (*i.e.*, are agonists to) activity. Therapeutics that upregulate activity may be administered in a therapeutic or prophylactic manner. Therapeutics that may be utilized include, but are not limited to, an aforementioned peptide, or analogs, derivatives,

25   fragments or homologs thereof; or an agonist that increases bioavailability.

Increased or decreased levels can be readily detected by quantifying peptide and/or RNA, by obtaining a patient tissue sample (*e.g.*, from biopsy tissue) and assaying it *in vitro* for RNA or peptide levels, structure and/or activity of the expressed peptides (or mRNAs of an aforementioned peptide). Methods that are well-known within the art include, but are not

30   limited to, immunoassays (*e.g.*, by Western blot analysis, immunoprecipitation followed by sodium dodecyl sulfate (SDS) polyacrylamide gel electrophoresis, immunocytochemistry, *etc.*) and/or hybridization assays to detect expression of mRNAs (*e.g.*, Northern assays, dot blots, *in situ* hybridization, and the like).

Prophylactic Methods

In one aspect, the invention provides a method for preventing, in a subject, a disease or condition associated with an aberrant NOVX expression or activity, by administering to

5   the subject an agent that modulates NOVX expression or at least one NOVX activity. Subjects at risk for a disease that is caused or contributed to by aberrant NOVX expression or activity can be identified by, for example, any or a combination of diagnostic or prognostic assays as described herein. Administration of a prophylactic agent can occur prior to the manifestation of symptoms characteristic of the NOVX aberrancy, such that a disease or

10   disorder is prevented or, alternatively, delayed in its progression. Depending upon the type of NOVX aberrancy, for example, a NOVX agonist or NOVX antagonist agent can be used for treating the subject. The appropriate agent can be determined based on screening assays described herein. The prophylactic methods of the invention are further discussed in the following subsections.

15

Therapeutic Methods

Another aspect of the invention pertains to methods of modulating NOVX expression or activity for therapeutic purposes. The modulatory method of the invention involves contacting a cell with an agent that modulates one or more of the activities of NOVX protein

20   activity associated with the cell. An agent that modulates NOVX protein activity can be an agent as described herein, such as a nucleic acid or a protein, a naturally-occurring cognate ligand of a NOVX protein, a peptide, a NOVX peptidomimetic, or other small molecule. In one embodiment, the agent stimulates one or more NOVX protein activity. Examples of such stimulatory agents include active NOVX protein and a nucleic acid molecule encoding

25   NOVX that has been introduced into the cell. In another embodiment, the agent inhibits one or more NOVX protein activity. Examples of such inhibitory agents include antisense NOVX nucleic acid molecules and anti-NOVX antibodies. These modulatory methods can be performed *in vitro* (*e.g.*, by culturing the cell with the agent) or, alternatively, *in vivo* (*e.g.*, by administering the agent to a subject). As such, the invention provides methods of treating

30   an individual afflicted with a disease or disorder characterized by aberrant expression or activity of a NOVX protein or nucleic acid molecule. In one embodiment, the method involves administering an agent (*e.g.*, an agent identified by a screening assay described herein), or combination of agents that modulates (*e.g.*, up-regulates or down-regulates) NOVX expression or activity. In another embodiment, the method involves administering a

80

NOVX protein or nucleic acid molecule as therapy to compensate for reduced or aberrant NOVX expression or activity.

Stimulation of NOVX activity is desirable *in situ*ations in which NOVX is abnormally downregulated and/or in which increased NOVX activity has a beneficial effect. One

5   example of such a situation is where a subject has a disorder characterized by aberrant cell proliferation and/or differentiation (*e.g.*, cancer or immune associated disorders). Another example of such a situation is where the subject has a gestational disease (*e.g.*, preclampsia).

Determination of the Biological Effect of the Therapeutic

In various embodiments of the invention, suitable *in vitro* or *in vivo* assays are

10   performed to determine the effect of a specific Therapeutic and whether its administration is indicated for treatment of the affected tissue.

In various specific embodiments, *in vitro* assays may be performed with representative cells of the type(s) involved in the patient's disorder, to determine if a given Therapeutic exerts the desired effect upon the cell type(s). Compounds for use in therapy

15   may be tested in suitable animal model systems including, but not limited to rats, mice, chicken, cows, monkeys, rabbits, and the like, prior to testing in human subjects. Similarly, for *in vivo* testing, any of the animal model system known in the art may be used prior to administration to human subjects.

Prophylactic and Therapeutic Uses of the Compositions of the Invention

20   The NOVX nucleic acids and proteins of the invention are useful in potential prophylactic and therapeutic applications implicated in a variety of disorders including, but not limited to: metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cancer, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, hematopoietic disorders, and the various dyslipidemias, metabolic

25   disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers.

As an example, a cDNA encoding the NOVX protein of the invention may be useful in gene therapy, and the protein may be useful when administered to a subject in need thereof. By way of non-limiting example, the compositions of the invention will have

30   efficacy for treatment of patients suffering from: metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative disorders,

Alzheimer's Disease, Parkinson's Disorder, immune disorders, hematopoietic disorders, and the various dyslipidemias.

Both the novel nucleic acid encoding the NOVX protein, and the NOVX protein of the invention, or fragments thereof, may also be useful in diagnostic applications, wherein the

5 presence or amount of the nucleic acid or the protein are to be assessed. A further use could be as an anti-bacterial molecule (*i.e.*, some peptides have been found to possess anti-bacterial properties). These materials are further useful in the generation of antibodies, which immunospecifically-bind to the novel substances of the invention for use in therapeutic or diagnostic methods.

Sequence comparison of the above protein sequences yields the following sequence
relationships shown in Table 1B.

Table 1B. Comparison of NOV1a against NOV1b and NOV1c.		
Protein Sequence	NOV1a Residues/ Match Residues	Identities/ Similarities for the Matched Region
NOV1b	1..928 1..925	833/929 (89%) 866/929 (92%)
NOV1c	30..928 2..893	808/899 (89%) 844/899 (93%)

5

Further analysis of the NOV1a protein yielded the following properties shown in Table 1C.

Table 1C. Protein Sequence Properties NOV1a	
PSort analysis:	0.6400 probability located in plasma membrane; 0.4600 probability located in Golgi body; 0.3700 probability located in endoplasmic reticulum (membrane); 0.1000 probability located in endoplasmic reticulum (lumen)
SignalP analysis:	Cleavage site between residues 31 and 32

A search of the NOV1a protein against the Geneseq database, a proprietary database that

5   contains sequences published in patents and patent publication, yielded several homologous

proteins shown in Table 1D.

Table 1D. Geneseq Results for NOV1a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV1a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAM47745	Human natrium(+)-calcium(2+) exchanger form 3 protein, HNCX3 - Homo sapiens, 927 aa. [WO200183744-A2, 08-NOV-2001]	1..928 1..927	862/929 (92%) 900/929 (96%)	0.0

AAM53461	Human brain expressed single exon probe encoded protein SEQ ID NO: 25566 - Homo sapiens, 609 aa. [WO200157275-A2, 09-AUG-2001]	1..593 11..608	420/606 (69%) 496/606 (81%)	0.0

In a BLAST search of public sequence datbases, the NOV1a protein was found to have

10   homology to the proteins shown in the BLASTP data in Table 1E.

87

Table 1E. Public BLASTP Results for NOV1a				
Protein Accession Number	Protein/Organism/Length	NOV1a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
Q96QG1	SODIUM/CALCIUM EXCHANGER SCL8A3 - Homo sapiens (Human), 924 aa.	1..928 1..924	866/929 (93%) 903/929 (96%)	0.0
Q96QG2	SODIUM/CALCIUM EXCHANGER SCL8A3 - Homo sapiens (Human), 925 aa.	1..928 1..925	857/930 (92%) 892/930 (95%)	0.0
P70549	Sodium/calcium exchanger 3 precursor (Na(+)/Ca(2+)-exchange protein 3) - Rattus norvegicus (Rat), 927 aa.	1..928 1..927	848/929 (91%) 895/929 (96%)	0.0
AAL39160	SODIUM/CALCIUM EXCHANGER - Mus musculus (Mouse), 928 aa.	1..928 1..928	837/929 (90%) 879/929 (94%)	0.0
Q9UPR5	Sodium/calcium exchanger 2 precursor (Na(+)/Ca(2+)-exchange protein 2) - Homo sapiens (Human), 921 aa.	48..928 43..921	701/890 (78%) 788/890 (87%)	0.0

PFam analysis indicates that the NOV1a protein contains the domains shown in Table 1F.

Table 1F. Domain Analysis of NOV1a			
Pfam Domain	NOV1a Match Region	Identities/ Similarities for the Matched Region	Expect Value
Filo_VP35: domain 1 of 1	184..199	7/16 (44%) 10/16 (62%)	6.1
Na_Ca_Ex: domain 1 of 2	110..257	35/153 (23%) 120/153 (78%)	1.2e-32
Glycos_transf_4: domain 1 of 1	760..910	33/215 (15%) 95/215 (44%)	5.7
Na_Ca_Ex: domain 2 of 2	764..912	55/152 (36%) 130/152 (86%)	2.1e-48

Example 2.

The NOV2 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 2A.

Table 2A. NOV2 Sequence Analysis

Further analysis of the NOV2a protein yielded the following properties shown in Table 2B.

Table 2B. Protein Sequence Properties NOV2a	
PSort analysis:	0.4600 probability located in plasma membrane; 0.1000 probability located in endoplasmic reticulum (membrane); 0.1000 probability located in endoplasmic reticulum (lumen); 0.1000 probability located in outside
SignalP analysis:	Cleavage site between residues 35 and 36

A search of the NOV2a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 2C.

Table 2C. Geneseq Results for NOV2a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV2a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAU29042	Human PRO polypeptide sequence #19 - Homo sapiens, 737 aa. [WO200168848-A2, 20-SEP-2001]	1..737 1..737	737/737 (100%) 737/737 (100%)	0.0
AAB01313	Human PRO299 polypeptide - Homo sapiens, 737 aa. [WO200032776-A2, 08-JUN-2000]	1..737 1..737	737/737 (100%) 737/737 (100%)	0.0
AAY17822	Human PRO299 protein sequence - Homo sapiens, 737 aa. [WO9928462-A2, 10-JUN-1999]	1..737 1..737	737/737 (100%) 737/737 (100%)	0.0
AAW39257	Human membrane protein - Homo sapiens, 737 aa. [JP10036395-A, 10-FEB-1998]	1..737 1..737	737/737 (100%) 737/737 (100%)	0.0

5

In a BLAST search of public sequence datbases, the NOV4a protein was found to have homology to the proteins shown in the BLASTP data in Table 4D.

Table 4D. Public BLASTP Results for NOV4a				
Protein Accession Number	Protein/Organism/Length	NOV4a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
P78310	Coxsackievirus and adenovirus receptor precursor (Coxsackievirus B-adenovirus receptor) (hCAR) (CVB3 binding protein) - Homo sapiens (Human), 365 aa.	141..505 1..365	364/365 (99%) 364/365 (99%)	0.0
Q9UKV4	COXSACKIE AND ADENOVIRUS RECEPTOR PROTEIN - Homo sapiens (Human), 344 aa (fragment).	141..479 1..339	338/339 (99%) 338/339 (99%)	0.0
AAK57804	COXSACKIE VIRUS AND ADENOVIRUS RECEPTOR BCAR - Bos taurus (Bovine), 365 aa.	141..505 1..365	331/365 (90%) 345/365 (93%)	0.0
P97792	Coxsackievirus and adenovirus receptor homolog precursor (mCAR) - Mus musculus (Mouse), 365 aa.	141..505 1..365	327/365 (89%) 344/365 (93%)	0.0
Q9DBJ8	COXSACKIEVIRUS AND ADENOVIRUS RECEPTOR - Mus musculus (Mouse), 366 aa.	141..505 1..366	327/366 (89%) 344/366 (93%)	0.0

PFam analysis indicates that the NOV4a protein contains the domains shown in Table 4E.

Table 4E. Domain Analysis of NOV4a			
Pfam Domain	NOV4a Match Region	Identities/ Similarities for the Matched Region	Expect Value
ig: domain 1 of 2	174..262	13/90 (14%) 62/90 (69%)	0.0054
ig: domain 2 of 2	295..354	11/62 (18%) 46/62 (74%)	1.5e-05
Adeno_E3_CR2: domain 1 of 1	372..417	15/50 (30%) 24/50 (48%)	4.9

5

Example 5.

The NOV5 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 5A.

Table 5A. NOV5 Sequence Analysis

In a BLAST search of public sequence datbases, the NOV7a protein was found to have homology to the proteins shown in the BLASTP data in Table 7D.

Table 7D. Public BLASTP Results for NOV7a				
Protein Accession Number	**Protein/Organism/Length**	**NOV7a Residues/ Match Residues**	**Identities/ Similarities for the Matched Portion**	**Expect Value**
S35691	cyclic nucleotide-gated channel protein - rabbit, 732 aa.	1..664 69..732	624/664 (93%) 643/664 (95%)	0.0
Q28718	Cyclic-nucleotide-gated olfactory channel (Cyclic-nucleotide-gated cation channel 2) (CNG channel 2) (CNG-2) (CNG2) (Aorta CNG channel) (RACNG) - Oryctolagus cuniculus (Rabbit), 664 aa.	1..664 1..664	624/664 (93%) 643/664 (95%)	0.0

Q03041	Cyclic-nucleotide-gated olfactory channel (Cyclic-nucleotide-gated cation channel 2) (CNG channel 2) (CNG-2) (CNG2) - Bos taurus (Bovine), 663 aa.	1..657 1..657	618/657 (94%) 639/657 (97%)	0.0
Q62398	Cyclic-nucleotide-gated olfactory channel (Cyclic-nucleotide-gated cation channel 2) (CNG channel 2) (CNG-2) (CNG2) - Mus musculus (Mouse), 664 aa.	1..662 2..664	618/663 (93%) 636/663 (95%)	0.0
Q00195	Cyclic-nucleotide-gated olfactory channel (Cyclic-nucleotide-gated cation channel 2) (CNG channel 2) (CNG2) (CNG-2) (OCNC1) - Rattus norvegicus (Rat), 664 aa.	1..662 2..664	615/663 (92%) 636/663 (95%)	0.0

PFam analysis indicates that the NOV7a protein contains the domains shown in Table 7E.

Table 7E. Domain Analysis of NOV7a			
Pfam Domain	**NOV7a Match Region**	**Identities/ Similarities for the Matched Region**	**Expect Value**
ion_trans: domain 1 of 1	174..371	35/236 (15%) 152/236 (64%)	5.1e-22
cNMP_binding: domain 1 of 1	469..565	34/120 (28%) 81/120 (68%)	1.4e-25

Example 8.

The NOV8 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 8A.

Further analysis of the NOV8a protein yielded the following properties shown in Table 8B.

Table 8B. Protein Sequence Properties NOV8a	
PSort analysis:	0.4600 probability located in plasma membrane; 0.3000 probability located in lysosome (membrane); 0.2800 probability located in endoplasmic reticulum (membrane); 0.1000 probability located in endoplasmic reticulum (lumen)
SignalP analysis:	Cleavage site between residues 32 and 33

A search of the NOV8a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 8C.

Table 8C. Geneseq Results for NOV8a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV8a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAU72892	Human metalloprotease partial protein sequence #4 - Homo sapiens, 731 aa. [WO200183782-A2, 08-NOV-2001]	1..733 1..731	639/734 (87%) 669/734 (91%)	0.0
AAE15652	Human disintegrin-like protein, NOV3 - Homo sapiens, 737 aa. [WO200194416-A2, 13-DEC-2001]	1..733 1..737	609/740 (82%) 645/740 (86%)	0.0
AAE14340	Human protease PRTS-5 protein - Homo sapiens, 576 aa. [WO200183775-A2, 08-NOV-2001]	447..733 294..576	253/287 (88%) 263/287 (91%)	e-157
AAB47561	Protease PRTS-3 - Homo sapiens, 559 aa. [WO200171004-A2, 27-SEP-2001]	1..329 1..332	270/335 (80%) 283/335 (83%)	e-153
AAY28655	Human SVPH1-8 protease - Homo sapiens, 722 aa. [WO9936549-A1, 22-JUL-1999]	8..676 8..675	243/692 (35%) 365/692 (52%)	e-123

In a BLAST search of public sequence datbases, the NOV8a protein was found to have homology to the proteins shown in the BLASTP data in Table 8D.

Table 8D. Public BLASTP Results for NOV8a				
Protein Accession Number	Protein/Organism/Length	NOV8a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
Q28484	TESTICULAR METALLOPROTEASE-LIKE, DISINTEGRIN-LIKE, CYSTEINE-RICH PROTEIN IVA - Macaca fascicularis (Crab eating macaque) (Cynomolgus monkey), 732 aa.	1..733 1..732	622/734 (84%) 666/734 (89%)	0.0

Q28485	TESTICULAR METALLOPROTEASE-LIKE, DISINTEGRIN-LIKE, CYSTEINE-RICH PROTEIN IVB - Macaca fascicularis (Crab eating macaque) (Cynomolgus monkey), 713 aa (fragment).	20..733 1..713	603/715 (84%) 651/715 (90%)	0.0
O19050	CELLULAR DISINTEGRIN ADAM 6D - Oryctolagus cuniculus (Rabbit), 731 aa.	4..733 4..731	424/736 (57%) 526/736 (70%)	0.0
O19051	CELLULAR DISINTEGRIN ADAM 6E - Oryctolagus cuniculus (Rabbit), 730 aa.	14..733 10..730	415/724 (57%) 518/724 (71%)	0.0
P70535	TMDC IV PROTEIN - Rattus norvegicus (Rat), 751 aa.	1..720 8..732	385/728 (52%) 487/728 (66%)	0.0

PFam analysis indicates that the NOV8a protein contains the domains shown in Table 8E.

Table 8E. Domain Analysis of NOV8a			
Pfam Domain	**NOV8a Match Region**	**Identities/ Similarities for the Matched Region**	**Expect Value**
Pep_M12B_propep: domain 1 of 1	77..192	42/119 (35%) 102/119 (86%)	1.3e-44
Reprolysin: domain 1 of 1	216..395	45/210 (21%) 108/210 (51%)	0.00095
metalthio: domain 1 of 1	395..458	14/67 (21%) 32/67 (48%)	7
disintegrin: domain 1 of 1	414..489	32/76 (42%) 44/76 (58%)	2.2e-18

Example 9.

The NOV9 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 9A.

Sequence comparison of the above protein sequences yields the following sequence relationships shown in Table 9B.

Table 9B. Comparison of NOV9a against NOV9b through NOV9d.		
Protein Sequence	**NOV9a Residues/ Match Residues**	**Identities/ Similarities for the Matched Region**
NOV9b	1..540 1..544	485/545 (88%) 493/545 (89%)
NOV9c	1..526 1..530	481/531 (90%) 489/531 (91%)
NOV9d	1..526 29..558	480/531 (90%) 488/531 (91%)

5

Further analysis of the NOV9a protein yielded the following properties shown in Table 9C.

Table 9C. Protein Sequence Properties NOV9a	
PSort analysis:	0.6000 probability located in plasma membrane; 0.4000 probability located in Golgi body; 0.3000 probability located in endoplasmic reticulum (membrane); 0.3000 probability located in microbody (peroxisome)
SignalP analysis:	Cleavage site between residues 65 and 66

10   A search of the NOV9a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 9D.

Table 9D. Geneseq Results for NOV9a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV9a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAM51858	Human TRP-like calcium channel TLCC-2 - Homo sapiens, 580 aa. [WO200177331-A1, 18-OCT-2001]	9..533 37..579	262/550 (47%) 374/550 (67%)	e-142
AAB74707	Human membrane associated protein MEMAP-13 - Homo sapiens, 580 aa. [WO200112662-A2, 22-FEB-2001]	9..533 37..579	262/550 (47%) 374/550 (67%)	e-142
AAB93412	Human protein sequence SEQ ID NO:12616 - Homo sapiens, 497 aa. [EP1074617-A2, 07-FEB-2001]	109..523 76..497	241/426 (56%) 318/426 (74%)	e-139
AAB08906	Human secreted protein sequence encoded by gene 16 SEQ ID NO:63 - Homo sapiens, 511 aa. [WO200017222-A1, 30-MAR-2000]	42..533 1..510	244/517 (47%) 349/517 (67%)	e-131
ABB11279	Human secreted protein homologue, SEQ ID NO:1649 - Homo sapiens, 164 aa. [WO200157188-A2, 09-AUG-2001]	334..497 1..164	161/164 (98%) 163/164 (99%)	3e-90

In a BLAST search of public sequence datbases, the NOV9a protein was found to have homology to the proteins shown in the BLASTP data in Table 9E.

Table 9E. Public BLASTP Results for NOV9a				
Protein Accession Number	Protein/Organism/Length	NOV9a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
Q9CQD3	3300002C04RIK PROTEIN - Mus musculus (Mouse), 538 aa.	1..523 1..527	426/528 (80%) 466/528 (87%)	0.0

AAL84622	MUCOLIPIN-3 - Homo sapiens (Human), 553 aa.	10..523 35..553	304/525 (57%) 396/525 (74%)	e-177
AAL84623	MUCOLIPIN-3 - Mus musculus (Mouse), 553 aa.	3..523 23..553	306/534 (57%) 398/534 (74%)	e-176
Q9H4B3	MUCOLIPIDIN - Homo sapiens (Human), 580 aa.	9..533 37..579	262/550 (47%) 374/550 (67%)	e-142
Q9GZU1	CDNA: FLJ22449 FIS, CLONE HRC09609 (MUCOLIPIN) (MUCOLIPIDOSIS TYPE IV PROTEIN) (MUCOLIPIN 1) - Homo sapiens (Human), 580 aa.	9..533 37..579	262/550 (47%) 374/550 (67%)	e-142

PFam analysis indicates that the NOV9a protein contains the domains shown in Table 9F.

Table 9F. Domain Analysis of NOV9a			
Pfam Domain	**NOV9a Match Region**	**Identities/ Similarities for the Matched Region**	**Expect Value**
DUF214: domain 1 of 1	231..407	30/267 (11%) 117/267 (44%)	9.2
ion_trans: domain 1 of 1	314..474	31/236 (13%) 117/236 (50%)	0.01

Example 10.

The NOV10 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 10A.

NOV10h	19..171 2..154	149/153 (97%) 151/153 (98%)

5

Further analysis of the NOV10a protein yielded the following properties shown in Table 10C.

Table 10C. Protein Sequence Properties NOV10a	
PSort analysis:	0.4600 probability located in plasma membrane; 0.1031 probability located in microbody (peroxisome); 0.1000 probability located in endoplasmic reticulum (membrane); 0.1000 probability located in endoplasmic reticulum (lumen)
SignalP analysis:	Cleavage site between residues 20 and 21

10 A search of the NOV10a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 10D.

Table 10D. Geneseq Results for NOV10a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV10a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAU68550	Human novel cytokine encoded by cDNA 790CIP2D_11 #1 - Homo sapiens, 239 aa. [WO200175093-A1, 11-OCT-2001]	1..171 69..239	150/171 (87%) 158/171 (91%)	5e-85
AAY53032	Human secreted protein clone di393_2 protein sequence SEQ ID NO:70 - Homo sapiens, 171 aa. [WO9957132-A1, 11-NOV-1999]	1..171 1..171	150/171 (87%) 158/171 (91%)	5e-85
AAG00463	Human secreted protein, SEQ ID NO: 4544 - Homo sapiens, 101 aa. [EP1033401-A2, 06-SEP-2000]	1..101 1..101	92/101 (91%) 93/101 (91%)	2e-49
AAY12683	Human 5' EST secreted protein SEQ ID NO:273 - Homo sapiens, 101 aa. [WO9906549-A2, 11-FEB-1999]	1..101 1..101	92/101 (91%) 93/101 (91%)	2e-49
AAM87953	Human immune/haematopoietic antigen SEQ ID NO:15546 - Homo sapiens, 89 aa. [WO200157182-A2, 09-AUG-2001]	83..171 1..89	70/89 (78%) 79/89 (88%)	1e-34

In a BLAST search of public sequence datbases, the NOV10a protein was found to have homology to the proteins shown in the BLASTP data in Table 10E.

Table 10E. Public BLASTP Results for NOV10a				
Protein Accession Number	Protein/Organism/Length	NOV10a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
Q9HCV6	DJ1153D9.4 (NOVEL PROTEIN) - Homo sapiens (Human), 138 aa (fragment).	34..171 1..138	138/138 (100%) 138/138 (100%)	7e-79

119

Q9D9T2	1700029J11RIK PROTEIN - Mus musculus (Mouse), 170 aa.	4..170 5..169	99/168 (58%) 122/168 (71%)	2e-46
Q96C09	SIMILAR TO NEURONAL THREAD PROTEIN - Homo sapiens (Human), 106 aa.	1..88 1..88	83/88 (94%) 85/88 (96%)	9e-45
Q9HCV7	DJ1153D9.3 (NOVEL PROTEIN) - Homo sapiens (Human), 94 aa.	1..86 1..86	81/86 (94%) 81/86 (94%)	4e-42
Q9CRL6	2810426N06RIK PROTEIN - Mus musculus (Mouse), 300 aa (fragment).	13..51 188..232	17/45 (37%) 24/45 (52%)	4.4

No significant matches were found in a PFam analysis of the NOV10a protein.

5   **Example 11.**

The NOV11 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 11A.

Sequence comparison of the above protein sequences yields the following sequence

relationships shown in Table 11B.

Table 11B. Comparison of NOV11a against NOV11b.		
Protein Sequence	NOV11a Residues/ Match Residues	Identities/ Similarities for the Matched Region
NOV11b	1..383 1..383	353/383 (92%) 353/383 (92%)

Further analysis of the NOV11a protein yielded the following properties shown in Table 11C.

Table 11C. Protein Sequence Properties NOV11a	
PSort analysis:	0.4600 probability located in plasma membrane; 0.1000 probability located in endoplasmic reticulum (membrane); 0.1000 probability located in endoplasmic reticulum (lumen); 0.1000 probability located in outside

SignalP analysis:	Cleavage site between residues 24 and 25

A search of the NOV11a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 11D.

Further analysis of the NOV13a protein yielded the following properties shown in Table 13B.

Table 13B. Protein Sequence Properties NOV13a	
PSort analysis:	0.4600 probability located in plasma membrane; 0.1561 probability located in microbody (peroxisome); 0.1000 probability located in endoplasmic reticulum (membrane); 0.1000 probability located in endoplasmic reticulum (lumen)
SignalP analysis:	Cleavage site between residues 34 and 35

A search of the NOV13a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 13C.

Table 13C. Geneseq Results for NOV13a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV13a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAU09864	Novel human secreted protein #5 – Homo sapiens, 801 aa. [WO200179454-A1, 25-OCT-2001]	41..821 38..796	412/784 (52%) 540/784 (68%)	0.0

AAM78375	Human protein SEQ ID NO 1037 - Homo sapiens, 788 aa. [WO200157190-A2, 09-AUG-2001]	50..825 43..788	393/779 (50%) 546/779 (69%)	0.0
AAW13132	Full length human cadherin-8 - Homo sapiens, 793 aa. [US5597725-A, 28-JAN-1997]	17..824 7..792	394/816 (48%) 560/816 (68%)	0.0

Further analysis of the NOV15a protein yielded the following properties shown in Table 15B.

Table 15B. Protein Sequence Properties NOV15a	
PSort analysis:	0.7900 probability located in plasma membrane; 0.3000 probability located in microbody (peroxisome); 0.3000 probability located in Golgi body; 0.2000 probability located in endoplasmic reticulum (membrane)
SignalP analysis:	Cleavage site between residues 70 and 71

5

A search of the NOV15a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 15C.

10

Table 15C. Geneseq Results for NOV15a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV15a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAB82352	Protein sequence SEQ ID NO.2 - Homo sapiens, 794 aa. [WO200138357-A2, 31-MAY-2001]	12..766 1..728	696/756 (92%) 703/756 (92%)	0.0
AAE03600	Human leucine-rich repeat-containing protein, AZAD - Homo sapiens, 794 aa. [WO200142286-A2, 14-JUN-2001]	12..766 1..728	696/756 (92%) 703/756 (92%)	0.0
AAB99488	Human chondroadherin protein sequence - Homo sapiens, 381 aa. [WO200137861-A1, 31-MAY-2001]	436..758 41..335	124/323 (38%) 178/323 (54%)	2e-56
AAR85888	WD-40 domain-contg. insulin-like growth factor binding protein - Synthetic, 605 aa. [WO9521252-A2, 10-AUG-1995]	71..541 35..537	166/556 (29%) 209/556 (36%)	8e-37
AAB38400	Fragment of human secreted protein encoded by gene 3 clone HSYAV50 - Homo sapiens, 723 aa. [WO200061623-A1, 19-OCT-2000]	39..450 36..464	137/441 (31%) 180/441 (40%)	3e-31

In a BLAST search of public sequence datbases, the NOV15a protein was found to have homology to the proteins shown in the BLASTP data in Table 15D.

Table 15D. Public BLASTP Results for NOV15a				
Protein Accession Number	Protein/Organism/Length	NOV15a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
Q9UGS3	DJ756G23.1 (NOVEL LEUCINE RICH PROTEIN) - Homo sapiens (Human), 797 aa (fragment).	43..766 40..737	684/724 (94%) 689/724 (94%)	0.0
CAC42683	SEQUENCE 1 FROM PATENT WO0142286 - Homo sapiens (Human), 794 aa.	12..766 1..728	696/756 (92%) 703/756 (92%)	0.0

137

O70210	CHONDROADHERIN PRECURSOR - Rattus norvegicus (Rat), 358 aa.	436..758 18..312	125/323 (38%) 178/323 (54%)	3e-56
Q96RJ5	CHONDROADHERIN - Homo sapiens (Human), 359 aa.	436..758 19..313	124/323 (38%) 178/323 (54%)	6e-56
A53860	chondroadherin precursor - bovine, 361 aa.	436..758 21..315	124/323 (38%) 178/323 (54%)	1e-55

PFam analysis indicates that the NOV15a protein contains the domains shown in Table 15E.

Table 15E. Domain Analysis of NOV15a			
Pfam Domain	**NOV15a Match Region**	**Identities/ Similarities for the Matched Region**	**Expect Value**
Trypan_glycop: domain 1 of 1	56..76	10/21 (48%) 20/21 (95%)	2.7

Sequence comparison of the above protein sequences yields the following sequence relationships shown in Table 16B.

Table 16B. Comparison of NOV16a against NOV16b.		
Protein Sequence	NOV16a Residues/ Match Residues	Identities/ Similarities for the Matched Region
NOV16b	1..925 15..939	752/925 (81%) 752/925 (81%)

Further analysis of the NOV16a protein yielded the following properties shown in Table 16C.

Table 16C. Protein Sequence Properties NOV16a	
PSort analysis:	0.8500 probability located in endoplasmic reticulum (membrane); 0.4400

	microbody (peroxisome); 0.3000 probability located in nucleus
SignalP analysis:	Cleavage site between residues 41 and 42

A search of the NOV16a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 16D.

Table 16D. Geneseq Results for NOV16a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV16a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAB95753	Human protein sequence SEQ ID NO:18665 - Homo sapiens, 958 aa. [EP1074617-A2, 07-FEB-2001]	1..925 1..925	925/925 (100%) 925/925 (100%)	0.0
ABB12025	Human IGFALS homologue, SEQ ID NO:2395 - Homo sapiens, 977 aa. [WO200157188-A2, 09-AUG-2001]	1..925 20..944	924/925 (99%) 924/925 (99%)	0.0
AAG67524	Amino acid sequence of a human secreted polypeptide - Homo sapiens, 845 aa. [WO200166690-A2, 13-SEP-2001]	46..925 27..812	423/886 (47%) 563/886 (62%)	0.0
AAE01232	Human gene 1 encoded secreted protein HMIAJ30, SEQ ID NO:94 - Homo sapiens, 845 aa. [WO200134769-A2, 17-MAY-2001]	46..925 27..812	422/886 (47%) 562/886 (62%)	0.0
AAE01312	Human gene 1 encoded secreted protein fragment, SEQ ID NO:177 - Homo sapiens, 596 aa. [WO200134769-A2, 17-MAY-2001]	46..630 6..583	336/594 (56%) 436/594 (72%)	0.0

In a BLAST search of public sequence datbases, the NOV16a protein was found to have homology to the proteins shown in the BLASTP data in Table 16E.

143

Table 16E. Public BLASTP Results for NOV16a				
Protein Accession Number	Protein/Organism/Length	NOV16a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
O94991	Hypothetical protein KIAA0918 - Homo sapiens (Human), 966 aa (fragment).	1..925 9..933	925/925 (100%) 925/925 (100%)	0.0
Q9H156	BG115M3.1 (NOVEL PROTEIN) - Homo sapiens (Human), 845 aa.	46..925 27..812	423/886 (47%) 563/886 (62%)	0.0
O94933	Hypothetical protein KIAA0848 - Homo sapiens (Human), 977 aa.	9..773 4..764	370/787 (47%) 511/787 (64%)	0.0
Q96JH3	KIAA1854 PROTEIN - Homo sapiens (Human), 572 aa (fragment).	46..599 33..571	325/555 (58%) 419/555 (74%)	0.0
CAB65788	BG256O22.1 (SIMILAR TO IGFALS (INSULIN-LIKE GROWTH FACTOR BINDING PROTEIN, ACID LABILE SUBUNIT)) - Homo sapiens (Human), 853 aa (fragment).	16..713 15..683	348/703 (49%) 468/703 (66%)	0.0

PFam analysis indicates that the NOV16a protein contains the domains shown in Table 16F.

Table 16F. Domain Analysis of NOV16a			
Pfam Domain	NOV16a Match Region	Identities/ Similarities for the Matched Region	Expect Value
LRRNT: domain 1 of 2	47..82	12/37 (32%) 23/37 (62%)	23
LRR: domain 1 of 10	82..105	9/25 (36%) 13/25 (52%)	4.8e+02
LRR: domain 2 of 10	106..129	5/25 (20%) 16/25 (64%)	80
LRR: domain 3 of 10	130..153	9/25 (36%) 19/25 (76%)	1.6
LRR: domain 4 of 10	154..177	10/25 (40%) 21/25 (84%)	0.0061
LRR: domain 5 of 10	178..200	9/25 (36%) 16/25 (64%)	43
LRR: domain 6 of 10	201..222	10/25 (40%) 17/25 (68%)	48

LRRCT: domain 1 of 2	235..285	18/54 (33%) 34/54 (63%)	3e-08
LRRNT: domain 2 of 2	373..406	10/35 (29%) 19/35 (54%)	0.049
LRR: domain 7 of 10	434..457	9/25 (36%) 17/25 (68%)	0.17
LRR: domain 8 of 10	458..481	10/25 (40%) 22/25 (88%)	0.00064
LRR: domain 9 of 10	482..505	6/25 (24%) 18/25 (72%)	0.096
LRR: domain 10 of 10	506..529	10/25 (40%) 19/25 (76%)	0.0085
LRRCT: domain 2 of 2	563..613	12/54 (22%) 38/54 (70%)	5.6e-05

Example 17.

The NOV17 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 17A.

5

Further analysis of the NOV17a protein yielded the following properties shown in Table 17B.

Table 17B. Protein Sequence Properties NOV17a	
PSort analysis:	0.8000 probability located in nucleus; 0.6000 probability located in plasma membrane; 0.4000 probability located in Golgi body; 0.3000 probability located in endoplasmic reticulum (membrane)
SignalP analysis:	Cleavage site between residues 43 and 44

5

A search of the NOV17a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 17C.

10

Table 17C. Geneseq Results for NOV17a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV17a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
ABG22977	Novel human diagnostic protein #22968 - Homo sapiens, 4591 aa. [WO200175067-A2, 11-OCT-2001]	119..4188 134..4099	1159/4320 (26%) 1853/4320 (42%)	0.0
ABG22977	Novel human diagnostic protein #22968 - Homo sapiens, 4591 aa. [WO200175067-A2, 11-OCT-2001]	119..4188 134..4099	1159/4320 (26%) 1853/4320 (42%)	0.0
AAM52106	Rat fat 3 protein SEQ ID NO 3 - Rattus norvegicus, 4555 aa. [JP2001258573-A, 25-SEP-2001]	70..3771 192..3829	1054/3877 (27%) 1742/3877 (44%)	0.0
AAU07054	Human Flamingo protein encoded by cDNA splice variant - Homo sapiens, 2923 aa. [WO200161003-A1, 23-AUG-2001]	2627..4042 162..1566	427/1490 (28%) 665/1490 (43%)	e-137
AAU07053	Human Flamingo polypeptide - Homo sapiens, 2956 aa. [WO200161003-A1, 23-AUG-2001]	2627..4042 162..1566	427/1490 (28%) 665/1490 (43%)	e-137

In a BLAST search of public sequence datbases, the NOV17a protein was found to have homology to the proteins shown in the BLASTP data in Table 17D.

5

Table 17D. Public BLASTP Results for NOV17a				
Protein Accession Number	Protein/Organism/Length	NOV17a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
P33450	Cadherin-related tumor suppressor precursor (Fat protein) - Drosophila melanogaster (Fruit fly), 5147 aa.	49..1878 71..1951	748/1932 (38%) 1066/1932 (54%)	0.0
IJFFTM	cadherin-related tumor suppressor precursor - fruit fly (Drosophila melanogaster), 5147 aa.	49..1878 71..1951	744/1932 (38%) 1065/1932 (54%)	0.0

Q96JQ0	Protocadherin 16 precursor (Cadherin 19) (Cadherin fibroblast 1) - Homo sapiens (Human), 3298 aa.	5..1877 12..1883	621/1950 (31%) 925/1950 (46%)	0.0
Q99PF4	Cadherin 23 precursor (Otocadherin) - Mus musculus (Mouse), 3354 aa.	53..1877 588..2430	606/1927 (31%) 896/1927 (46%)	0.0
P58365	Cadherin 23 precursor (Otocadherin) - Rattus norvegicus (Rat), 3317 aa.	53..1877 586..2428	613/1928 (31%) 897/1928 (45%)	0.0

PFam analysis indicates that the NOV17a protein contains the domains shown in Table 17E.

Table 17E. Domain Analysis of NOV17a			
Pfam Domain	NOV17a Match Region	Identities/ Similarities for the Matched Region	Expect Value
cadherin: domain 1 of 30	47..126	19/107 (18%) 59/107 (55%)	0.012

Sequence comparison of the above protein sequences yields the following sequence

relationships shown in Table 18B.

Table 18B. Comparison of NOV18a against NOV18b.		
Protein Sequence	**NOV18a Residues/ Match Residues**	**Identities/ Similarities for the Matched Region**
NOV18b	29..680 2..661	629/660 (95%) 636/660 (96%)

Further analysis of the NOV18a protein yielded the following properties shown in Table 18C.

Table 18C. Protein Sequence Properties NOV18a	
PSort analysis:	0.7480 probability located in microbody (peroxisome); 0.6736 probability located in nucleus; 0.6415 probability located in mitochondrial matrix space; 0.3377 probability located in mitochondrial inner membrane
SignalP analysis:	Cleavage site between residues 30 and 31

A search of the NOV18a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 18D.

Table 18D. Geneseq Results for NOV18a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV18a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
ABB53298	Human polypeptide #38 - Homo sapiens, 686 aa. [WO200181363-A1, 01-NOV-2001]	17..680 15..686	659/672 (98%) 661/672 (98%)	0.0
AAB01432	Human TANGO 239 (form 2) - Homo sapiens, 686 aa. [WO200039284-A1, 06-JUL-2000]	17..680 15..686	655/672 (97%) 660/672 (97%)	0.0
ABB53297	Human polypeptide #37 - Homo sapiens, 640 aa. [WO200181363-A1, 01-NOV-2001]	52..680 4..640	624/637 (97%) 626/637 (97%)	0.0
AAB01426	Human TANGO 239 - Homo sapiens, 549 aa. [WO200039284-A1, 06-JUL-2000]	17..506 15..504	482/490 (98%) 487/490 (99%)	0.0
AAB00036	Human TANGO 239 partial sequence - Homo sapiens, 465 aa. [WO200039284-A1, 06-JUL-2000]	26..500 1..465	456/475 (96%) 461/475 (97%)	0.0

In a BLAST search of public sequence datbases, the NOV18a protein was found to have homology to the proteins shown in the BLASTP data in Table 18E.

Table 18E. Public BLASTP Results for NOV18a				
Protein Accession Number	Protein/Organism/Length	NOV18a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
Q91641	Thyroid hormone-induced protein B precursor - Xenopus laevis (African clawed frog), 688 aa.	1..680 1..688	438/689 (63%) 547/689 (78%)	0.0
Q96BM4	HYPOTHETICAL 26.4 KDA PROTEIN - Homo sapiens (Human), 232 aa.	457..680 1..232	222/232 (95%) 223/232 (95%)	e-129
CAD13324	BA373A9.2 (NOVEL PROTEIN (ORTHOLOG OF X.LAEVIS THYROID HORMONE-INDUCED PROTEIN B)) - Homo sapiens (Human), 135 aa (fragment).	554..680 1..135	127/135 (94%) 127/135 (94%)	4e-67
Q63191	Apical endosomal glycoprotein precursor - Rattus norvegicus (Rat), 1216 aa.	272..670 587..975	108/412 (26%) 182/412 (43%)	5e-29
Q9GMT4	HYPOTHETICAL 51.2 KDA PROTEIN - Macaca fascicularis (Crab eating macaque) (Cynomolgus monkey), 448 aa.	511..666 240..411	66/172 (38%) 87/172 (50%)	1e-20

PFam analysis indicates that the NOV18a protein contains the domains shown in Table 18F.

Table 18F. Domain Analysis of NOV18a			
Pfam Domain	NOV18a Match Region	Identities/ Similarities for the Matched Region	Expect Value
MAM: domain 1 of 4	28..171	54/176 (31%) 123/176 (70%)	1.3e-34
MAM: domain 2 of 4	172..331	49/175 (28%) 115/175 (66%)	3.5e-35
TonB_boxC: domain 1 of 1	448..463	2/16 (12%) 14/16 (88%)	5
MAM: domain 3 of 4	344..500	59/174 (34%) 120/174 (69%)	7.3e-43

5

pili_assembly_C: domain 1 of 1	607..623	5/17 (29%) 15/17 (88%)	6.8
MAM: domain 4 of 4	511..668	68/174 (39%) 129/174 (74%)	6.8e-59

Example 19.

The NOV19 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 19A.

Further analysis of the NOV19a protein yielded the following properties shown in Table 19B.

Table 19B. Protein Sequence Properties NOV19a	
PSort analysis:	0.6400 probability located in plasma membrane; 0.4600 probability located in Golgi body; 0.3700 probability located in endoplasmic reticulum (membrane); 0.1000 probability located in endoplasmic reticulum (lumen)
SignalP analysis:	Cleavage site between residues 29 and 30

A search of the NOV19a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 19C.

Table 19C. Geneseq Results for NOV19a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV19a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAY31642	Human transport-associated protein-4 (TRANP-4) - Homo sapiens, 465 aa. [WO9941373-A2, 19-AUG-1999]	5..218 14..227	75/214 (35%) 116/214 (54%)	1e-33
AAM93737	Human polypeptide, SEQ ID NO: 3705 - Homo sapiens, 471 aa. [EP1130094-A2, 05-SEP-2001]	7..201 33..228	67/196 (34%) 109/196 (55%)	5e-30

In a BLAST search of public sequence datbases, the NOV20a protein was found to have homology to the proteins shown in the BLASTP data in Table 20D.

Table 20D. Public BLASTP Results for NOV20a				
Protein Accession Number	Protein/Organism/Length	NOV20a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
Q9Y3M2	HYPOTHETICAL 14.5 KDA PROTEIN (CHROMOSOME 22 OPEN READING FRAME 2) - Homo sapiens (Human), 126 aa.	44..169 1..126	126/126 (100%) 126/126 (100%)	4e-66
AAL56062	CYTOSOLIC LEUCINE-RICH PROTEIN - Homo sapiens (Human), 126 aa.	44..169 1..126	125/126 (99%) 126/126 (99%)	1e-65
Q9D1C2	1110014P06RIK PROTEIN (RIKEN CDNA 1110014P06 GENE) - Mus musculus (Mouse), 127 aa.	44..169 1..126	104/126 (82%) 120/126 (94%)	1e-56
Q9UIK9	HRIHFB2025 PROTEIN - Homo sapiens (Human), 67 aa (fragment).	103..169 1..67	67/67 (100%) 67/67 (100%)	1e-29
Q9CVN6	1700121K02RIK PROTEIN - Mus musculus (Mouse), 226 aa (fragment).	47..160 70..191	45/122 (36%) 69/122 (55%)	2e-15

PFam analysis indicates that the NOV20a protein contains the domains shown in Table 20E.

Table 20E. Domain Analysis of NOV20a			
Pfam Domain	NOV20a Match Region	Identities/ Similarities for the Matched Region	Expect Value
Transposase_8: domain 1 of 1	54..149	22/99 (22%) 64/99 (65%)	2.9

5

Example 21.

The NOV21 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 21A.

Sequence comparison of the above protein sequences yields the following sequence relationships shown in Table 23B.

Table 23B. Comparison of NOV23a against NOV23b.		
Protein Sequence	NOV23a Residues/ Match Residues	Identities/ Similarities for the Matched Region
NOV23b	35..565 3..533	492/531 (92%) 493/531 (92%)

Further analysis of the NOV23a protein yielded the following properties shown in Table 23C.

Table 23C. Protein Sequence Properties NOV23a	
PSort analysis:	0.6000 probability located in plasma membrane; 0.4000 probability located in Golgi body; 0.3000 probability located in endoplasmic reticulum (membrane); 0.1000 probability located in mitochondrial inner membrane
SignalP analysis:	Cleavage site between residues 35 and 36

A search of the NOV23a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 23D.

Table 23D. Geneseq Results for NOV23a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV23a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAR63069	Human EAA3c excitatory amino acid receptor - Homo sapiens, 865 aa. [CA2110933-A, 12-JUN-1994]	1..862 1..862	853/862 (98%) 853/862 (98%)	0.0
AAB19496	The Q591 form of the human EAA3 receptor - Homo sapiens, 905 aa. [US6136544-A, 24-OCT-2000]	1..858 1..858	851/858 (99%) 851/858 (99%)	0.0
AAR75883	Human EAA3 receptor (Q-591) - Homo sapiens, 905 aa. [WO9517508-A2, 29-JUN-1995]	1..858 1..858	851/858 (99%) 851/858 (99%)	0.0

| AAR60112 | Human EAA3a excitatory amino acid receptor - Homo sapiens, 905 aa. [CA2110933-A, 12-JUN-1994] | 1..858 1..858 | 851/858 (99%) 851/858 (99%) | 0.0 |
| AAB19499 | Amino acid sequence of the R591 form of the human EAA3 receptor - Homo sapiens, 905 aa. [US6136544-A, 24-OCT-2000] | 1..858 1..858 | 850/858 (99%) 851/858 (99%) | 0.0 |

In a BLAST search of public sequence datbases, the NOV23a protein was found to have homology to the proteins shown in the BLASTP data in Table 23E.

Table 23E. Public BLASTP Results for NOV23a				
Protein Accession Number	Protein/Organism/Length	NOV23a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
P39086	Glutamate receptor, ionotropic kainate 1 precursor (Glutamate receptor 5) (GLUR-5) (GluR5) (Excitatory amino acid receptor 3) (EAA3) - Homo sapiens (Human), 918 aa.	1..903 1..918	900/918 (98%) 900/918 (98%)	0.0
CAC80546	GLUTAMATE RECEPTOR SUBUNIT GLUR5 - Homo sapiens (Human), 905 aa.	1..858 1..858	852/858 (99%) 852/858 (99%)	0.0
P22756	Glutamate receptor, ionotropic kainate 1 precursor (Glutamate receptor 5) (GLUR-5) (GluR5) - Rattus norvegicus (Rat), 949 aa.	1..854 1..869	823/869 (94%) 838/869 (95%)	0.0
Q9DGM1	GLUTAMATE RECEPTOR 5 - Danio aequipinnatus (Giant danio) (Brachydanio aequipinnatus), 880 aa.	32..854 32..868	735/837 (87%) 789/837 (93%)	0.0
Q60934	Glutamate receptor, ionotropic kainate 1 precursor (Glutamate receptor 5) (GLUR-5) (GluR5) - Mus musculus (Mouse), 836 aa.	1..756 1..758	707/758 (93%) 727/758 (95%)	0.0

PFam analysis indicates that the NOV23a protein contains the domains shown in Table 23F.

174

Table 23F. Domain Analysis of NOV23a			
Pfam Domain	**NOV23a Match Region**	**Identities/ Similarities for the Matched Region**	**Expect Value**
ANF_receptor: domain 1 of 1	25..415	95/466 (20%) 351/466 (75%)	8.9e-114
SBP_bac_3: domain 1 of 1	434..801	46/425 (11%) 216/425 (51%)	0.79
lig_chan: domain 1 of 1	560..841	161/322 (50%) 272/322 (84%)	4.8e-161

Example 24.

The NOV24 clone was analyzed, and the nucleotide and encoded polypeptide sequences are

shown in Table 24A.

Further analysis of the NOV24a protein yielded the following properties shown in Table 24B.

Table 24B. Protein Sequence Properties NOV24a	
PSort analysis:	0.9325 probability located in endoplasmic reticulum (membrane); 0.6976 probability located in plasma membrane; 0.3200 probability located in microbody (peroxisome); 0.1900 probability located in Golgi body
SignalP analysis:	Cleavage site between residues 17 and 18

5   A search of the NOV24a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 24C.

Table 24C. Geneseq Results for NOV24a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV24a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAU03900	Human protease-like polypeptide #2 - Homo sapiens, 348 aa. [WO200149864-A1, 12-JUL-2001]	92..418 59..348	288/327 (88%) 288/327 (88%)	e-168
AAU03901	Human protease-like polypeptide #3 - Homo sapiens, 288 aa. [WO200149864-A1, 12-JUL-2001]	96..418 3..288	284/323 (87%) 285/323 (87%)	e-166
AAU03899	Human protease-like polypeptide #1 - Homo sapiens, 217 aa. [WO200149864-A1, 12-JUL-2001]	174..418 1..217	217/245 (88%) 217/245 (88%)	e-126
AAW96812	A mouse serine protease called hepsin - Mus musculus, 416 aa. [WO9854307-A1, 03-DEC-1998]	56..397 62..414	119/398 (29%) 178/398 (43%)	4e-41
AAY43325	Mouse hepsin protein sequence - Mus musculus, 416 aa. [US5981830-A, 09-NOV-1999]	56..397 62..414	119/398 (29%) 178/398 (43%)	4e-41

10   In a BLAST search of public sequence datbases, the NOV24a protein was found to have homology to the proteins shown in the BLASTP data in Table 24D.

Table 24D. Public BLASTP Results for NOV24a				
Protein Accession Number	Protein/Organism/Length	NOV24a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
AAL50817	AIRWAY TRYPSIN-LIKE PROTEASE - Rattus norvegicus (Rat), 417 aa.	96..385 171..413	104/290 (35%) 146/290 (49%)	1e-42
Q29015	PREPROACROSIN - Sus sp, 415 aa.	85..383 4..283	116/318 (36%) 150/318 (46%)	2e-42
P08001	Acrosin precursor (EC 3.4.21.10) (53 kDa fucose-binding protein) - Sus scrofa (Pig), 415 aa.	85..383 4..283	116/318 (36%) 150/318 (46%)	2e-42
Q9QZ74	ADRENAL SECRETORY SERINE PROTEASE PRECURSOR - Rattus norvegicus (Rat), 279 aa.	96..385 33..275	104/290 (35%) 145/290 (49%)	3e-42
O35453	Serine protease hepsin (EC 3.4.21.-) - Mus musculus (Mouse), 416 aa.	84..397 139..414	104/324 (32%) 156/324 (48%)	2e-40

PFam analysis indicates that the NOV24a protein contains the domains shown in Table 24E.

Table 24E. Domain Analysis of NOV24a			
Pfam Domain	NOV24a Match Region	Identities/ Similarities for the Matched Region	Expect Value
trypsin: domain 1 of 2	111..263	67/174 (39%) 115/174 (66%)	1.2e-41
trypsin: domain 2 of 2	287..383	41/105 (39%) 72/105 (69%)	4.1e-25

5

Example 25.

The NOV25 clone was analyzed, and the nucleotide and encoded polypeptide sequences are shown in Table 25A.

Sequence comparison of the above protein sequences yields the following sequence relationships shown in Table 25B.

Table 25B. Comparison of NOV25a against NOV25b and NOV25c.		
Protein Sequence	**NOV25a Residues/ Match Residues**	**Identities/ Similarities for the Matched Region**
NOV25b	1..741 1832..2572	730/741 (98%) 730/741 (98%)
NOV25c	1..741 1162..1902	728/741 (98%) 728/741 (98%)

5

Further analysis of the NOV25a protein yielded the following properties shown in Table 25C.

Table 25C. Protein Sequence Properties NOV25a	
PSort analysis:	0.6500 probability located in cytoplasm; 0.1000 probability located in mitochondrial matrix space; 0.1000 probability located in lysosome (lumen); 0.0000 probability located in endoplasmic reticulum (membrane)
SignalP analysis:	No Known Signal Sequence

A search of the NOV25a protein against the Geneseq database, a proprietary database that contains sequences published in patents and patent publication, yielded several homologous proteins shown in Table 25D.

Table 25D. Geneseq Results for NOV25a				
Geneseq Identifier	Protein/Organism/Length [Patent #, Date]	NOV25a Residues/ Match Residues	Identities/ Similarities for the Matched Region	Expect Value
AAB95002	Human protein sequence SEQ ID NO:16644 - Homo sapiens, 741 aa. [EP1074617-A2, 07-FEB-2001]	1..741 1..741	741/741 (100%) 741/741 (100%)	0.0
AAU16959	Human novel secreted protein, SEQ ID 200 - Homo sapiens, 877 aa. [WO200155441-A2, 02-AUG-2001]	1..741 137..877	741/741 (100%) 741/741 (100%)	0.0
AAG67241	Amino acid sequence of human thrombospondin 1-like protein - Homo sapiens, 780 aa. [WO200109321-A1, 08-FEB-2001]	1..741 40..780	741/741 (100%) 741/741 (100%)	0.0
AAG67244	Amino acid sequence of murine thrombospondin 1-like protein - Mus musculus, 1068 aa. [WO200109321-A1, 08-FEB-2001]	1..741 328..1068	673/741 (90%) 707/741 (94%)	0.0
AAG67243	Amino acid sequence of murine thrombospondin 1-like protein - Mus musculus, 744 aa. [WO200109321-A1, 08-FEB-2001]	1..741 4..744	673/741 (90%) 707/741 (94%)	0.0

In a BLAST search of public sequence datbases, the NOV25a protein was found to have homology to the proteins shown in the BLASTP data in Table 25E.

Table 25E. Public BLASTP Results for NOV25a				
Protein Accession Number	Protein/Organism/Length	NOV25a Residues/ Match Residues	Identities/ Similarities for the Matched Portion	Expect Value
Q96K89	CDNA FLJ14438 FIS, CLONE HEMBB1000317, WEAKLY SIMILAR TO FIBULIN-1, ISOFORM D PRECURSOR - Homo sapiens (Human), 741 aa.	1..741 1..741	741/741 (100%) 741/741 (100%)	0.0
Q96SC3	FIBULIN-6 - Homo sapiens (Human), 2673 aa (fragment).	1..580 1816..2396	559/581 (96%) 567/581 (97%)	0.0
Q96RW7	HEMICENTIN - Homo sapiens (Human), 5636 aa.	1..580 4779..5359	559/581 (96%) 566/581 (97%)	0.0
Q95NZ3	F56H11.1B PROTEIN - Caenorhabditis elegans, 689 aa.	311..741 223..689	160/480 (33%) 224/480 (46%)	4e-62
Q9TZS1	FIBULIN-1D - Caenorhabditis elegans, 589 aa (fragment).	311..741 123..589	160/480 (33%) 224/480 (46%)	4e-62

PFam analysis indicates that the NOV25a protein contains the domains shown in Table 25F.

Table 25F. Domain Analysis of NOV25a			
Pfam Domain	NOV25a Match Region	Identities/ Similarities for the Matched Region	Expect Value
tsp_1: domain 1 of 1	41..91	23/54 (43%) 39/54 (72%)	6.7e-13
EGF: domain 1 of 7	334..368	16/47 (34%) 25/47 (53%)	8.4e-06
granulin: domain 1 of 1	355..370	7/16 (44%) 11/16 (69%)	4.2
EGF: domain 2 of 7	374..413	14/48 (29%) 25/48 (52%)	2
EGF: domain 3 of 7	419..451	12/47 (26%) 24/47 (51%)	0.0045

5

Example B: Identification of NOVX clones

The novel NOVX target sequences identified in the present invention may have been subjected to the exon linking process to confirm the sequence. PCR primers were designed by starting at the most upstream sequence available, for the forward primer, and at the most

5   downstream sequence available for the reverse primer. In each case, the sequence was examined, walking inward from the respective termini toward the coding sequence, until a suitable sequence that is either unique or highly selective was encountered, or, in the case of the reverse primer, until the stop codon was reached. Such primers were designed based on *in silico* predictions for the full length cDNA, part (one or more exons) of the DNA or protein

10   sequence of the target sequence, or by translated homology of the predicted exons to closely related human sequences from other species. These primers were then employed in PCR amplification based on the following pool of human cDNAs: adrenal gland, bone marrow, brain - amygdala, brain - cerebellum, brain - hippocampus, brain - substantia nigra, brain - thalamus, brain -whole, fetal brain, fetal kidney, fetal liver, fetal lung, heart, kidney,

15   lymphoma - Raji, mammary gland, pancreas, pituitary gland, placenta, prostate, salivary gland, skeletal muscle, small intestine, spinal cord, spleen, stomach, testis, thyroid, trachea, and uterus.

Usually the resulting amplicons were gel purified, cloned and sequenced to high redundancy. The PCR product derived from exon linking was cloned into the pCR2.1 vector

20   from Invitrogen. The resulting bacterial clone has an insert covering the entire open reading frame cloned into the pCR2.1 vector. The resulting sequences from all clones were assembled with themselves, with other fragments in CuraGen Corporation's database and with public ESTs. Fragments and ESTs were included as components for an assembly when the extent of their identity with another component of the assembly was at least 95% over 50

25   bp. In addition, sequence traces were evaluated manually and edited for corrections if appropriate. These procedures provide the sequence reported herein.

Example C: Quantitative expression analysis of clones in various cells and tissues

30   The quantitative expression of various clones was assessed using microtiter plates containing RNA samples from a variety of normal and pathology-derived cells, cell lines and tissues using real time quantitative PCR (RTQ PCR). RTQ PCR was performed on an Applied Biosystems ABI PRISM® 7700 or an ABI PRISM® 7900 HT Sequence Detection System. Various collections of samples are assembled on the plates, and referred to as Panel

1 (containing normal tissues and cancer cell lines), Panel 2 (containing samples derived from tissues from normal and cancer sources), Panel 3 (containing cancer cell lines), Panel 4 (containing cells and cell lines from normal tissues and cells related to inflammatory conditions), Panel 5D/5I (containing human tissues and cell lines with an emphasis on

5   metabolic diseases), AI_comprehensive_panel (containing normal tissue and samples from autoimmune diseases), Panel CNSD.01 (containing central nervous system samples from normal and diseased brains) and CNS_neurodegeneration_panel (containing samples from normal and Alzheimer's diseased brains).

RNA integrity from all samples is controlled for quality by visual assessment of

10   agarose gel electropherograms using 28S and 18S ribosomal RNA staining intensity ratio as a guide (2:1 to 2.5:1 28s:18s) and the absence of low molecular weight RNAs that would be indicative of degradation products. Samples are controlled against genomic DNA contamination by RTQ PCR reactions run in the absence of reverse transcriptase using probe and primer sets designed to amplify across the span of a single exon.

15   First, the RNA samples were normalized to reference nucleic acids such as constitutively expressed genes (for example, β-actin and GAPDH). Normalized RNA (5 ul) was converted to cDNA and analyzed by RTQ-PCR using One Step RT-PCR Master Mix Reagents (Applied Biosystems; Catalog No. 4309169) and gene-specific primers according to the manufacturer's instructions.

20   In other cases, non-normalized RNA samples were converted to single strand cDNA (sscDNA) using Superscript II (Invitrogen Corporation; Catalog No. 18064-147) and random hexamers according to the manufacturer's instructions. Reactions containing up to 10 µg of total RNA were performed in a volume of 20 µl and incubated for 60 minutes at 42 °C. This reaction can be scaled up to 50 µg of total RNA in a final volume of 100 µl. sscDNA samples

25   are then normalized to reference nucleic acids as described previously, using 1X TaqMan® Universal Master mix (Applied Biosystems; catalog No. 4324020); following the manufacturer's instructions.

Probes and primers were designed for each assay according to Applied Biosystems Primer Express Software package (version I for Apple Computer's Macintosh Power PC) or a

30   similar algorithm using the target sequence as input. Default settings were used for reaction conditions and the following parameters were set before selecting primers: primer

195

concentration = 250 nM, primer melting temperature (Tm) range = 58 °-60 °C, primer optimal

Tm = 59 °C, maximum primer difference = 2 °C, probe does not have 5'G, probe Tm must be

10 °C greater than primer Tm, amplicon size 75bp to 100bp. The probes and primers selected

(see below) were synthesized by Synthegen (Houston, TX, USA). Probes were double

5   purified by HPLC to remove uncoupled dye and evaluated by mass spectroscopy to verify

coupling of reporter and quencher dyes to the 5' and 3' ends of the probe, respectively. Their

final concentrations were: forward and reverse primers, 900nM each, and probe, 200nM.

PCR conditions: When working with RNA samples, normalized RNA from each

tissue and each cell line was spotted in each well of either a 96 well or a 384-well PCR plate

10   (Applied Biosystems). PCR cocktails included either a single gene specific probe and primers

set, or two multiplexed probe and primers sets (a set specific for the target clone and another

gene-specific set multiplexed with the target probe). PCR reactions were set up using

TaqMan® One-Step RT-PCR Master Mix (Applied Biosystems, Catalog No. 4313803)

following manufacturer's instructions. Reverse transcription was performed at 48 °C for 30

15   minutes followed by amplification/PCR cycles as follows: 95°C 10 min, then 40 cycles of 95

°C for 15 seconds, 60 °C for 1 minute. Results were recorded as CT values (cycle at which a

given sample crosses a threshold level of fluorescence) using a log scale, with the difference

in RNA concentration between a given sample and the sample with the lowest CT value

being represented as 2 to the power of delta CT. The percent relative expression is then

20   obtained by taking the reciprocal of this RNA difference and multiplying by 100.

When working with sscDNA samples, normalized sscDNA was used as described

previously for RNA samples. PCR reactions containing one or two sets of probe and primers

were set up as described previously, using 1X TaqMan® Universal Master mix (Applied

Biosystems; catalog No. 4324020), following the manufacturer's instructions. PCR

25   amplification was performed as follows: 95 °C 10 min, then 40 cycles of 95 °C for 15

seconds, 60 °C for 1 minute. Results were analyzed and processed as described previously.

Panels 1, 1.1, 1.2, and 1.3D

The plates for Panels 1, 1.1, 1.2 and 1.3D include 2 control wells (genomic DNA

control and chemistry control) and 94 wells containing cDNA from various samples. The

30   samples in these panels are broken into 2 classes: samples derived from cultured cell lines

and samples derived from primary normal tissues. The cell lines are derived from cancers of

196

the following types: lung cancer, breast cancer, melanoma, colon cancer, prostate cancer, CNS cancer, squamous cell carcinoma, ovarian cancer, liver cancer, renal cancer, gastric cancer and pancreatic cancer. Cell lines used in these panels are widely available through the American Type Culture Collection (ATCC), a repository for cultured cell lines, and were

5   cultured using the conditions recommended by the ATCC. The normal tissues found on these panels are comprised of samples derived from all major organ systems from single adult individuals or fetuses. These samples are derived from the following organs: adult skeletal muscle, fetal skeletal muscle, adult heart, fetal heart, adult kidney, fetal kidney, adult liver, fetal liver, adult lung, fetal lung, various regions of the brain, the spleen, bone marrow, lymph

10   node, pancreas, salivary gland, pituitary gland, adrenal gland, spinal cord, thymus, stomach, small intestine, colon, bladder, trachea, breast, ovary, uterus, placenta, prostate, testis and adipose.

In the results for Panels 1, 1.1, 1.2 and 1.3D, the following abbreviations are used:

        ca. = carcinoma,
15   * = established from metastasis,
        met = metastasis,
        s cell var = small cell variant,
        non-s = non-sm = non-small,
        squam = squamous,
20   pl. eff = pl effusion = pleural effusion,
        glio = glioma,
        astro = astrocytoma, and
        neuro = neuroblastoma.

General_screening_panel_v1.4

25   The plates for Panel 1.4 include 2 control wells (genomic DNA control and chemistry control) and 94 wells containing cDNA from various samples. The samples in Panel 1.4 are broken into 2 classes: samples derived from cultured cell lines and samples derived from primary normal tissues. The cell lines are derived from cancers of the following types: lung cancer, breast cancer, melanoma, colon cancer, prostate cancer, CNS cancer, squamous cell

30   carcinoma, ovarian cancer, liver cancer, renal cancer, gastric cancer and pancreatic cancer. Cell lines used in Panel 1.4 are widely available through the American Type Culture Collection (ATCC), a repository for cultured cell lines, and were cultured using the conditions recommended by the ATCC. The normal tissues found on Panel 1.4 are comprised of pools of samples derived from all major organ systems from 2 to 5 different adult

35   individuals or fetuses. These samples are derived from the following organs: adult skeletal

muscle, fetal skeletal muscle, adult heart, fetal heart, adult kidney, fetal kidney, adult liver,
fetal liver, adult lung, fetal lung, various regions of the brain, the spleen, bone marrow, lymph
node, pancreas, salivary gland, pituitary gland, adrenal gland, spinal cord, thymus, stomach,
small intestine, colon, bladder, trachea, breast, ovary, uterus, placenta, prostate, testis and
5   adipose. Abbreviations are as described for Panels 1, 1.1, 1.2, and 1.3D.

Panels 2D and 2.2

The plates for Panels 2D and 2.2 generally include 2 control wells and 94 test samples
composed of RNA or cDNA isolated from human tissue procured by surgeons working in
close cooperation with the National Cancer Institute's Cooperative Human Tissue Network
10   (CHTN) or the National Disease Research Initiative (NDRI). The tissues are derived from
human malignancies and in cases where indicated many malignant tissues have "matched
margins" obtained from noncancerous tissue just adjacent to the tumor. These are termed
normal adjacent tissues and are denoted "NAT" in the results below. The tumor tissue and the
"matched margins" are evaluated by two independent pathologists (the surgical pathologists
15   and again by a pathologist at NDRI or CHTN). This analysis provides a gross
histopathological assessment of tumor differentiation grade. Moreover, most samples include
the original surgical pathology report that provides information regarding the clinical stage of
the patient. These matched margins are taken from the tissue surrounding (*i.e.* immediately
proximal) to the zone of surgery (designated "NAT", for normal adjacent tissue, in Table
20   RR). In addition, RNA and cDNA samples were obtained from various human tissues derived
from autopsies performed on elderly people or sudden death victims (accidents, *etc.*). These
tissues were ascertained to be free of disease and were purchased from various commercial
sources such as Clontech (Palo Alto, CA), Research Genetics, and Invitrogen.

Panel 3D

25   The plates of Panel 3D are comprised of 94 cDNA samples and two control samples.
Specifically, 92 of these samples are derived from cultured human cancer cell lines, 2
samples of human primary cerebellar tissue and 2 controls. The human cell lines are
generally obtained from ATCC (American Type Culture Collection), NCI or the German
tumor cell bank and fall into the following tissue groups: Squamous cell carcinoma of the
30   tongue, breast cancer, prostate cancer, melanoma, epidermoid carcinoma, sarcomas, bladder
carcinomas, pancreatic cancers, kidney cancers, leukemias/lymphomas,
ovarian/uterine/cervical, gastric, colon, lung and CNS cancer cell lines. In addition, there are·

two independent samples of cerebellum. These cells are all cultured under standard recommended conditions and RNA extracted using the standard procedures. The cell lines in panel 3D and 1.3D are of the most common cell lines used in the scientific literature.

Panels 4D, 4R, and 4.1D

5   Panel 4 includes samples on a 96 well plate (2 control wells, 94 test samples) composed of RNA (Panel 4R) or cDNA (Panels 4D/4.1D) isolated from various human cell lines or tissues related to inflammatory conditions. Total RNA from control normal tissues such as colon and lung (Stratagene, La Jolla, CA) and thymus and kidney (Clontech) was employed. Total RNA from liver tissue from cirrhosis patients and kidney from lupus patients

10   was obtained from BioChain (Biochain Institute, Inc., Hayward, CA). Intestinal tissue for RNA preparation from patients diagnosed as having Crohn's disease and ulcerative colitis was obtained from the National Disease Research Interchange (NDRI) (Philadelphia, PA).

Astrocytes, lung fibroblasts, dermal fibroblasts, coronary artery smooth muscle cells, small airway epithelium, bronchial epithelium, microvascular dermal endothelial cells,

15   microvascular lung endothelial cells, human pulmonary aortic endothelial cells, human umbilical vein endothelial cells were all purchased from Clonetics (Walkersville, MD) and grown in the media supplied for these cell types by Clonetics. These primary cell types were activated with various cytokines or combinations of cytokines for 6 and/or 12-14 hours, as indicated. The following cytokines were used; IL-1 beta at approximately 1-5ng/ml, TNF

20   alpha at approximately 5-10ng/ml, IFN gamma at approximately 20-50ng/ml, IL-4 at approximately 5-10ng/ml, IL-9 at approximately 5-10ng/ml, IL-13 at approximately 5-10ng/ml. Endothelial cells were sometimes starved for various times by culture in the basal media from Clonetics with 0.1% serum.

Mononuclear cells were prepared from blood of employees at CuraGen Corporation,

25   using Ficoll. LAK cells were prepared from these cells by culture in DMEM 5% FCS (Hyclone), 100μM non essential amino acids (Gibco/Life Technologies, Rockville, MD), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5×10^{-5}M (Gibco), and 10mM Hepes (Gibco) and Interleukin 2 for 4-6 days. Cells were then either activated with 10-20ng/ml PMA and 1-2μg/ml ionomycin, IL-12 at 5-10ng/ml, IFN gamma at 20-50ng/ml and IL-18 at

30   5-10ng/ml for 6 hours. In some cases, mononuclear cells were cultured for 4-5 days in DMEM 5% FCS (Hyclone), 100μM non essential amino acids (Gibco), 1mM sodium

pyruvate (Gibco), mercaptoethanol 5.5x10⁻⁵M (Gibco), and 10mM Hepes (Gibco) with PHA (phytohemagglutinin) or PWM (pokeweed mitogen) at approximately 5μg/ml. Samples were taken at 24, 48 and 72 hours for RNA preparation. MLR (mixed lymphocyte reaction) samples were obtained by taking blood from two donors, isolating the mononuclear cells

5   using Ficoll and mixing the isolated mononuclear cells 1:1 at a final concentration of approximately 2x10⁶cells/ml in DMEM 5% FCS (Hyclone), 100μM non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol (5.5x10⁻⁵M) (Gibco), and 10mM Hepes (Gibco). The MLR was cultured and samples taken at various time points ranging from 1- 7 days for RNA preparation.

10   Monocytes were isolated from mononuclear cells using CD14 Miltenyi Beads, +ve VS selection columns and a Vario Magnet according to the manufacturer's instructions. Monocytes were differentiated into dendritic cells by culture in DMEM 5% fetal calf serum (FCS) (Hyclone, Logan, UT), 100μM non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5x10⁻⁵M (Gibco), and 10mM Hepes (Gibco), 50ng/ml

15   GMCSF and 5ng/ml IL-4 for 5-7 days. Macrophages were prepared by culture of monocytes for 5-7 days in DMEM 5% FCS (Hyclone), 100μM non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5x10⁻⁵M (Gibco), 10mM Hepes (Gibco) and 10% AB Human Serum or MCSF at approximately 50ng/ml. Monocytes, macrophages and dendritic cells were stimulated for 6 and 12-14 hours with lipopolysaccharide (LPS) at

20   100ng/ml. Dendritic cells were also stimulated with anti-CD40 monoclonal antibody (Pharmingen) at 10μg/ml for 6 and 12-14 hours.

CD4 lymphocytes, CD8 lymphocytes and NK cells were also isolated from mononuclear cells using CD4, CD8 and CD56 Miltenyi beads, positive VS selection columns and a Vario Magnet according to the manufacturer's instructions. CD45RA and CD45RO

25   CD4 lymphocytes were isolated by depleting mononuclear cells of CD8, CD56, CD14 and CD19 cells using CD8, CD56, CD14 and CD19 Miltenyi beads and positive selection. CD45RO beads were then used to isolate the CD45RO CD4 lymphocytes with the remaining cells being CD45RA CD4 lymphocytes. CD45RA CD4, CD45RO CD4 and CD8 lymphocytes were placed in DMEM 5% FCS (Hyclone), 100μM non essential amino acids

30   (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5x10⁻⁵M (Gibco), and 10mM Hepes (Gibco) and plated at 10⁶cells/ml onto Falcon 6 well tissue culture plates that had been coated overnight with 0.5μg/ml anti-CD28 (Pharmingen) and 3ug/ml anti-CD3 (OKT3,

200

ATCC) in PBS. After 6 and 24 hours, the cells were harvested for RNA preparation. To prepare chronically activated CD8 lymphocytes, we activated the isolated CD8 lymphocytes for 4 days on anti-CD28 and anti-CD3 coated plates and then harvested the cells and expanded them in DMEM 5% FCS (Hyclone), 100μM non essential amino acids (Gibco),

5   1mM sodium pyruvate (Gibco), mercaptoethanol 5.5×10^{-5}M (Gibco), and 10mM Hepes (Gibco) and IL-2. The expanded CD8 cells were then activated again with plate bound anti-CD3 and anti-CD28 for 4 days and expanded as before. RNA was isolated 6 and 24 hours after the second activation and after 4 days of the second expansion culture. The isolated NK cells were cultured in DMEM 5% FCS (Hyclone), 100μM non essential amino acids (Gibco),

10   1mM sodium pyruvate (Gibco), mercaptoethanol 5.5×10^{-5}M (Gibco), and 10mM Hepes (Gibco) and IL-2 for 4-6 days before RNA was prepared.

To obtain B cells, tonsils were procured from NDRI. The tonsil was cut up with sterile dissecting scissors and then passed through a sieve. Tonsil cells were then spun down and resupended at 10^6 cells/ml in DMEM 5% FCS (Hyclone), 100μM non essential amino

15   acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5×10^{-5}M (Gibco), and 10mM Hepes (Gibco). To activate the cells, we used PWM at 5μg/ml or anti-CD40 (Pharmingen) at approximately 10μg/ml and IL-4 at 5-10ng/ml. Cells were harvested for RNA preparation at 24, 48 and 72 hours.

To prepare the primary and secondary Th1/Th2 and Tr1 cells, six-well Falcon plates

20   were coated overnight with 10μg/ml anti-CD28 (Pharmingen) and 2μg/ml OKT3 (ATCC), and then washed twice with PBS. Umbilical cord blood CD4 lymphocytes (Poietic Systems, German Town, MD) were cultured at 10^5-10^6 cells/ml in DMEM 5% FCS (Hyclone), 100μM non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5×10^{-5}M (Gibco), 10mM Hepes (Gibco) and IL-2 (4ng/ml). IL-12 (5ng/ml) and anti-IL4 (1μg/ml)

25   were used to direct to Th1, while IL-4 (5ng/ml) and anti-IFN gamma (1μg/ml) were used to direct to Th2 and IL-10 at 5ng/ml was used to direct to Tr1. After 4-5 days, the activated Th1, Th2 and Tr1 lymphocytes were washed once in DMEM and expanded for 4-7 days in DMEM 5% FCS (Hyclone), 100μM non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5×10^{-5}M (Gibco), 10mM Hepes (Gibco) and IL-2 (1ng/ml).

30   Following this, the activated Th1, Th2 and Tr1 lymphocytes were re-stimulated for 5 days with anti-CD28/OKT3 and cytokines as described above, but with the addition of anti-CD95L (1μg/ml) to prevent apoptosis. After 4-5 days, the Th1, Th2 and Tr1 lymphocytes

were washed and then expanded again with IL-2 for 4-7 days. Activated Th1 and Th2 lymphocytes were maintained in this way for a maximum of three cycles. RNA was prepared from primary and secondary Th1, Th2 and Tr1 after 6 and 24 hours following the second and third activations with plate bound anti-CD3 and anti-CD28 mAbs and 4 days into the second

5   and third expansion cultures in Interleukin 2.

The following leukocyte cells lines were obtained from the ATCC: Ramos, EOL-1, KU-812. EOL cells were further differentiated by culture in 0.1mM dbcAMP at 5×10^5 cells/ml for 8 days, changing the media every 3 days and adjusting the cell concentration to 5×10^5 cells/ml. For the culture of these cells, we used DMEM or RPMI (as

10   recommended by the ATCC), with the addition of 5% FCS (Hyclone), 100µM non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5×10^{-5} M (Gibco), 10mM Hepes (Gibco). RNA was either prepared from resting cells or cells activated with PMA at 10ng/ml and ionomycin at 1µg/ml for 6 and 14 hours. Keratinocyte line CCD106 and an airway epithelial tumor line NCI-H292 were also obtained from the ATCC. Both were

15   cultured in DMEM 5% FCS (Hyclone), 100µM non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5×10^{-5} M (Gibco), and 10mM Hepes (Gibco). CCD1106 cells were activated for 6 and 14 hours with approximately 5 ng/ml TNF alpha and 1ng/ml IL-1 beta, while NCI-H292 cells were activated for 6 and 14 hours with the following cytokines: 5ng/ml IL-4, 5ng/ml IL-9, 5ng/ml IL-13 and 25ng/ml IFN gamma.

20   For these cell lines and blood cells, RNA was prepared by lysing approximately 10^7 cells/ml using Trizol (Gibco BRL). Briefly, 1/10 volume of bromochloropropane (Molecular Research Corporation) was added to the RNA sample, vortexed and after 10 minutes at room temperature, the tubes were spun at 14,000 rpm in a Sorvall SS34 rotor. The aqueous phase was removed and placed in a 15ml Falcon Tube. An equal volume of

25   isopropanol was added and left at –20 °C overnight. The precipitated RNA was spun down at 9,000 rpm for 15 min in a Sorvall SS34 rotor and washed in 70% ethanol. The pellet was redissolved in 300µl of RNAse-free water and 35µl buffer (Promega) 5µl DTT, 7µl RNAsin and 8µl DNAse were added. The tube was incubated at 37 °C for 30 minutes to remove contaminating genomic DNA, extracted once with phenol chloroform and re-precipitated

30   with 1/10 volume of 3M sodium acetate and 2 volumes of 100% ethanol. The RNA was spun down and placed in RNAse free water. RNA was stored at –80 °C.

AI_comprehensive panel_v1.0

The plates for AI_comprehensive panel_v1.0 include two control wells and 89 test samples comprised of cDNA isolated from surgical and postmortem human tissues obtained from the Backus Hospital and Clinomics (Frederick, MD). Total RNA was extracted from tissue samples from the Backus Hospital in the Facility at CuraGen. Total RNA from other

5   tissues was obtained from Clinomics.

Joint tissues including synovial fluid, synovium, bone and cartilage were obtained from patients undergoing total knee or hip replacement surgery at the Backus Hospital. Tissue samples were immediately snap frozen in liquid nitrogen to ensure that isolated RNA was of optimal quality and not degraded. Additional samples of osteoarthritis and rheumatoid

10   arthritis joint tissues were obtained from Clinomics. Normal control tissues were supplied by Clinomics and were obtained during autopsy of trauma victims.

Surgical specimens of psoriatic tissues and adjacent matched tissues were provided as total RNA by Clinomics. Two male and two female patients were selected between the ages of 25 and 47. None of the patients were taking prescription drugs at the time samples were

15   isolated.

Surgical specimens of diseased colon from patients with ulcerative colitis and Crohns disease and adjacent matched tissues were obtained from Clinomics. Bowel tissue from three female and three male Crohn's patients between the ages of 41-69 were used. Two patients were not on prescription medication while the others were taking dexamethasone,

20   phenobarbital, or tylenol. Ulcerative colitis tissue was from three male and four female patients. Four of the patients were taking lebvid and two were on phenobarbital.

Total RNA from post mortem lung tissue from trauma victims with no disease or with emphysema, asthma or COPD was purchased from Clinomics. Emphysema patients ranged in age from 40-70 and all were smokers, this age range was chosen to focus on patients with

25   cigarette-linked emphysema and to avoid those patients with alpha-1anti-trypsin deficiencies. Asthma patients ranged in age from 36-75, and excluded smokers to prevent those patients that could also have COPD. COPD patients ranged in age from 35-80 and included both smokers and non-smokers. Most patients were taking corticosteroids, and bronchodilators.

In the labels employed to identify tissues in the AI_comprehensive panel_v1.0 panel,

30   the following abbreviations are used:

203

AI = Autoimmunity
Syn = Synovial
Normal = No apparent disease
Rep22 /Rep20 = individual patients
5   RA = Rheumatoid arthritis
Backus = From Backus Hospital
OA = Osteoarthritis
(SS) (BA) (MF) = Individual patients
Adj = Adjacent tissue
10   Match control = adjacent tissues
-M = Male
-F = Female
COPD = Chronic obstructive pulmonary disease

Panels 5D and 5I

15   The plates for Panel 5D and 5I include two control wells and a variety of cDNAs

isolated from human tissues and cell lines with an emphasis on metabolic diseases. Metabolic

tissues were obtained from patients enrolled in the Gestational Diabetes study. Cells were

obtained during different stages in the differentiation of adipocytes from human

mesenchymal stem cells. Human pancreatic islets were also obtained.

20   In the Gestational Diabetes study subjects are young (18 - 40 years), otherwise

healthy women with and without gestational diabetes undergoing routine (elective) Caesarean

section. After delivery of the infant, when the surgical incisions were being repaired/closed,

the obstetrician removed a small sample (<1 cc) of the exposed metabolic tissues during the

closure of each surgical level. The biopsy material was rinsed in sterile saline, blotted and

25   fast frozen within 5 minutes from the time of removal. The tissue was then flash frozen in

liquid nitrogen and stored, individually, in sterile screw-top tubes and kept on dry ice for

shipment to or to be picked up by CuraGen. The metabolic tissues of interest include uterine

wall (smooth muscle), visceral adipose, skeletal muscle (rectus) and subcutaneous adipose.

Patient descriptions are as follows:

30

Patient 2   Diabetic Hispanic, overweight, not on insulin
Patient 7-9   Nondiabetic Caucasian and obese (BMI>30)
Patient 10   Diabetic Hispanic, overweight, on insulin
Patient 11   Nondiabetic African American and overweight
35   Patient 12   Diabetic Hispanic on insulin

Adipocyte differentiation was induced in donor progenitor cells obtained from Osirus

(a division of Clonetics/BioWhittaker) in triplicate, except for Donor 3U which had only two

replicates. Scientists at Clonetics isolated, grew and differentiated human mesenchymal stem

cells (HuMSCs) for CuraGen based on the published protocol found in Mark F. Pittenger, et al., Multilineage Potential of Adult Human Mesenchymal Stem Cells Science Apr 2 1999: 143-147. Clonetics provided Trizol lysates or frozen pellets suitable for mRNA isolation and ds cDNA production. A general description of each donor is as follows:

5   Donor 2 and 3 U: Mesenchymal Stem cells, Undifferentiated Adipose
        Donor 2 and 3 AM: Adipose, AdiposeMidway Differentiated
        Donor 2 and 3 AD: Adipose, Adipose Differentiated

Human cell lines were generally obtained from ATCC (American Type Culture Collection), NCI or the German tumor cell bank and fall into the following tissue groups:

10   kidney proximal convoluted tubule, uterine smooth muscle cells, small intestine, liver HepG2 cancer cells, heart primary stromal cells, and adrenal cortical adenoma cells. These cells are all cultured under standard recommended conditions and RNA extracted using the standard procedures. All samples were processed at CuraGen to produce single stranded cDNA.

Panel 5I contains all samples previously described with the addition of pancreatic

15   islets from a 58 year old female patient obtained from the Diabetes Research Institute at the University of Miami School of Medicine. Islet tissue was processed to total RNA at an outside source and delivered to CuraGen for addition to panel 5I.

In the labels employed to identify tissues in the 5D and 5I panels, the following abbreviations are used:

20   GO Adipose = Greater Omentum Adipose
        SK = Skeletal Muscle
        UT = Uterus
        PL = Placenta
        AD = Adipose Differentiated
25   AM = Adipose Midway Differentiated
        U = Undifferentiated Stem Cells

Panel CNSD.01

The plates for Panel CNSD.01 include two control wells and 94 test samples comprised of cDNA isolated from postmortem human brain tissue obtained from the Harvard

30   Brain Tissue Resource Center. Brains are removed from calvaria of donors between 4 and 24 hours after death, sectioned by neuroanatomists, and frozen at -80°C in liquid nitrogen vapor. All brains are sectioned and examined by neuropathologists to confirm diagnoses with clear associated neuropathology.

Disease diagnoses are taken from patient records. The panel contains two brains from each of the following diagnoses: Alzheimer's disease, Parkinson's disease, Huntington's disease, Progressive Supernuclear Palsy, Depression, and "Normal controls". Within each of these brains, the following regions are represented: cingulate gyrus, temporal pole, globus

5 palladus, substantia nigra, Brodman Area 4 (primary motor strip), Brodman Area 7 (parietal cortex), Brodman Area 9 (prefrontal cortex), and Brodman area 17 (occipital cortex). Not all brain regions are represented in all cases; *e.g.*, Huntington's disease is characterized in part by neurodegeneration in the globus palladus, thus this region is impossible to obtain from confirmed Huntington's cases. Likewise Parkinson's disease is characterized by degeneration

10 of the substantia nigra making this region more difficult to obtain. Normal control brains were examined for neuropathology and found to be free of any pathology consistent with neurodegeneration.

In the labels employed to identify tissues in the CNS panel, the following abbreviations are used:

15   PSP = Progressive supranuclear palsy
          Sub Nigra = Substantia nigra
          Glob Palladus= Globus palladus
          Temp Pole = Temporal pole
          Cing Gyr = Cingulate gyrus
20   BA 4 = Brodman Area 4

Panel CNS_Neurodegeneration_V1.0

The plates for Panel CNS_Neurodegeneration_V1.0 include two control wells and 47 test samples comprised of cDNA isolated from postmortem human brain tissue obtained from the Harvard Brain Tissue Resource Center (McLean Hospital) and the Human Brain and

25 Spinal Fluid Resource Center (VA Greater Los Angeles Healthcare System). Brains are removed from calvaria of donors between 4 and 24 hours after death, sectioned by neuroanatomists, and frozen at -80°C in liquid nitrogen vapor. All brains are sectioned and examined by neuropathologists to confirm diagnoses with clear associated neuropathology.

Disease diagnoses are taken from patient records. The panel contains six brains from

30 Alzheimer's disease (AD) patients, and eight brains from "Normal controls" who showed no evidence of dementia prior to death. The eight normal control brains are divided into two categories: Controls with no dementia and no Alzheimer's like pathology (Controls) and controls with no dementia but evidence of severe Alzheimer's like pathology, (specifically

senile plaque load rated as level 3 on a scale of 0-3; 0 = no evidence of plaques, 3 = severe

AD senile plaque load). Within each of these brains, the following regions are represented:

hippocampus, temporal cortex (Brodman Area 21), parietal cortex (Brodman area 7), and

occipital cortex (Brodman area 17). These regions were chosen to encompass all levels of

5   neurodegeneration in AD. The hippocampus is a region of early and severe neuronal loss in

AD; the temporal cortex is known to show neurodegeneration in AD after the hippocampus;

the parietal cortex shows moderate neuronal death in the late stages of the disease; the

occipital cortex is spared in AD and therefore acts as a "control" region within AD patients.

Not all brain regions are represented in all cases.

10   In the labels employed to identify tissues in the CNS_Neurodegeneration_V1.0 panel, the

following abbreviations are used:

AD = Alzheimer's disease brain; patient was demented and showed AD-like
pathology upon autopsy
Control = Control brains; patient not demented, showing no neuropathology
15   Control (Path) = Control brains; pateint not demented but showing sever AD-like
pathology
SupTemporal Ctx = Superior Temporal Cortex
Inf Temporal Ctx = Inferior Temporal Cortex

A. NOV1a and NOV1b (CG56258-01 and CG56258-02: sodium/calcium
20   **exchanger)**

Expression of gene CG56258-021 and CG56258-02 was assessed using the primer-probe sets

Ag2903, Ag5035 and Ag6163, described in Tables AA, AB and AC. Results of the RTQ-

PCR runs are shown in Tables AD, AE, AF, AG, AH and AI.

25

AI_comprehensive panel_v1.0 Summary: Ag2903/Ag5035 Two experiments with two different probe and primer sets produce results that are in very good agreement. Expression of the CG56258-01 gene appears to be more highly associated with synovium and bone samples from patients with osteoarthritis when compared to expression in the control

5   samples. Thus, therapeutic modulation of the expression or function of this gene may be effective in the treatment of osteoarthritis. A third experiment with the probe and primer set Ag6163 shows low/undetectable levels of expression (CTs>35).

CNS_neurodegeneration_v1.0 Summary: Ag2903/Ag5035 Two experiments with two different probes and primers produce results that are in excellent agreement. This panel does

10   not show differential expression of the CG56258-01 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain, with highest expression in the hippocampus of an Alzheimer's patient and the occipital cortex of a control patient (CTs=28-30). Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

15   **General_screening_panel_v1.5 Summary:** Ag5035 Two experiments with the same probe and primer produce results that are in excellent agreement, with the CG56258-02 gene showing highly brain preferential expression (CTs=30-31). In addition, moderate levels of expression are seen in fetal and adult skeletal muscle (CTs=30-31). This expression profile is in excellent concordance with the results in Panel 1.3D. Please see Panel 1.3D for further

20   discussion of utility of this gene in the central nervous system and metabolic disease.

Panel 1.3D Summary: Ag2903 Expression of the CG56258-01 gene is highest in fetal skeletal muscle (CT=26.8). In addition, significant levels of expression are also seen in adult skeletal muscle and fetal heart. Thus, expression of this gene could be used to differentiate skeletal muscle derived samples from other samples on this panel and as a marker of skeletal

25   muscle. This gene encodes a putative sodium/calcium exchanger. Altered levels of intracellular calcium have been implicated in many diseases, including type 2 diabetes. Based on its expression profile and homology to a calcium transport protein, therapeutic modulation of the expression or function of this gene or gene product may be effective in the treatment of type 2 diabetes.

221

In addition, moderate to low levels of expression are seen in all regions of the CNS examined. Inhibition of calcium uptake has been shown to decrease neuronal death in response to cerebral ischemia. Therefore, this gene, a putative calcium transport protein, represents an excellent drug target for the treatment of stroke. Treatment with an antagonist

5   immediately after stroke could decrease total infarct volume and lessen the overall stroke severity.

See, generally,

Balasubramanyam M, Balaji RA, Subashini B, Mohan V. Evidence for mechanistic alterations of Ca2+ homeostasis in Type 2 diabetes mellitus. Int J Exp Diabetes Res

10   2001;1(4):275-87. PMID: 11467418; and

Matsuda T, Arakawa N, Takuma K, Kishida Y, Kawasaki Y, Sakaue M, Takahashi K, Takahashi T, Suzuki T, Ota T, Hamano-Takahashi A, Onishi M, Tanaka Y, Kameo K, Baba A. SEA0400, a novel and selective inhibitor of the Na+-Ca2+ exchanger, attenuates reperfusion injury in the in vitro and in vivo cerebral ischemic models. J Pharmacol Exp Ther

15   2001 Jul;298(1):249-56.

Panel 2D Summary: Ag2903 The expression of the CG56258-01 gene in this panel is consistent with the profile seen in Panel 1.3D. Expression is highest and most prominent in a normal muscle sample (CT=28.7). Please see Panel 1.3D for discussion of utility of this gene in metabolic disease.

20   **Panel 4.1D Summary:** Ag5035 Expression of the CG56258-02 gene is restricted to TNF-alpha and IL-1 beta treated lung and dermal microvasculature (CTs=33-34). Endothelial cells are known to play important roles in inflammatory responses by altering the expression of surface proteins that are involved in activation and recruitment of effector inflammatory cells. The expression of this gene in dermal microvascular endothelial cells suggests that this

25   protein product may be involved in inflammatory responses to skin disorders, including psoriasis. Expression in lung microvascular endothelial cells suggests that the protein encoded by this transcript may also be involved in lung disorders including asthma, allergies, chronic obstructive pulmonary disease, and emphysema. Therefore, therapeutic modulation of the protein encoded by this gene may lead to amelioration of symptoms associated with

30   psoriasis, asthma, allergies, chronic obstructive pulmonary disease, and emphysema.

Ag5035 Results from one experiment with this gene are not included. The amp plot indicates that there were experimental difficulties with this run.

Ag6163 Expression of this gene is low/undetectable in all samples on this panel (CTs>35).

B. NOV2a (CG59843-01: fibropellin III-like)

Expression of gene CG59843-01 was assessed using the primer-probe sets Ag2797, Ag3606 and Ag221, described in Tables BA, BB and BC. Results of the RTQ-PCR runs are shown in Tables BD, BE, BF, BG, BH, BI, BJ, BK and BL.

CNS_neurodegeneration_v1.0 Summary: Ag3606 This panel does not show differential expression of the CG59843-01 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain, with highest expression in the temporal cortex of an Alzheimer's patient (CT=26.3). Please see Panel 1.4 for discussion of utility of this gene in the central nervous system. Results from a second experiment using the probe and primer set Ag2797 are not included. The amp plot indicates that there were experimental difficulties with this run.

241

General_screening_panel_v1.4 Summary: Ag3606 Highest expresson of the CG59843-01 gene is seen in a brain cancer cell line (CT=24). In addition, this gene also shows highly brain preferential expression, with high levels of expression in all CNS regions represented on this panel. Therefore, expression of this gene could be used to differentiate between brain derived

5   samples and other samples on this panel. Furthermore, therapeutic modulation of the expression or function of this gene may be useful in the treatment of neurologic disorders, such as Alzheimer's disease, Parkinson's disease, schizophrenia, multiple sclerosis, stroke and epilepsy.

High levels of expression are also seen in samples derived from melanoma, lung and brain

10   cancer cell lines. Thus, expression of this gene could be used as a marker for these types of cancers. This gene encodes a fibropellin-like molecule. Fibropellins are glycoproteins that may be involved in cell adhesion. Therefore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of melanoma, lung and brain cancers.

See, generally,

15   Burke RD, Lail M, Nakajima Y. The apical lamina and its role in cell adhesion in sea urchin embryos. Cell Adhes Commun 1998 Mar;5(2):97-108. PMID: 9638331

Panel 1 Summary: Ag221 Expression in this panel is in agreement with the profile seen in Panel 1.4. The CG59843-01 gene shows highly brain preferential expression, with highest expression in the cerebellum (CT=21.4). Please see Panel 1.4 for discussion of utility of this

20   gene in the central nervous system.

Panel 1.3D Summary: Ag2797 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression in the thalamus (CTs=24.5-25.5).

High levels of expression are also seen in samples derived from melanoma, lung and brain

25   cancer cell lines. Please see Panel 1.4 for further discussion of utility of this gene in the CNS and cancer.

Moderate to low levels of expression are also seen in the adrenal, pituitary, fetal heart, and fetal skeletal muscle. This expression in metabolic tissues suggests that this gene product may

242

be involved in the pathogenesis and/or treatment of metabolic disorders, including obesity and diabetes.

Panel 2D Summary: Ag2797 Two experiments with the same probe and primer set produce results that are in excellent agreement. Highest expresson of the CG59843-01 gene is seen in
5   kidney (CTs=28). The expression of this gene is down-regulated in kidney cancers (CTs=31-38), gastric cancer and colon cancer as compared to control margin (CTs=28-31). Therefore, expression of this gene could be used to distinguish between normal kidney, stomach and colon tissue from cancer samples.

In addition significant expression of this gene is also seen in breast cancer, bladder cancer,
10   lung malignant cancer, and prostate cancer samples. Thus, therapeutic modulation of this gene, through the use of small molecule drugs, and antibodies could be of benefit in the treatment of bladder, breast, kidney or lung cancer.

Panel 3D Summary: Ag2797 Highest expression of the CG59843-01 gene is seen in a small cell lung cancer cell line (CT=25). Significant levels of expression are also seen in the
15   cerebellum. This is in agreement with the highly brain preferential expression profiles seen in the previous panels. Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel. In addition, significant expression of this gene is associated with squamous cell lung cancer, large cell lung cancer, lung carcinoid, rhabdomyosarcoma, fibrosarcoma, osteosarcoma, medulloblastoma, leiomyosarcoma,
20   cervical and pancreatic cancers. Therefore, therapeutic modulation of this gene or its product, through the use of small molecule drugs, and antibodies could be of benefit in the treatment of these cancers.

Panel 4.1D Summary: Ag3606/2797 The CG59843-01 gene was reproducibly expressed, as displayed on Panels 4D and 4.1D, across several activated cell types that model lung
25   inflammatory diseases. These include cytokine-activated lung fibroblasts, cytokine-activated pulmonary aortic endothelial cells, and cytokine-activated bronchial epithelial cells (CTs=28-31). Therefore, therapeutic modulation of this gene or its product, through the use of small molecule drugs, and antibodies, may reduce or eliminate the symptoms of inflammatory lung diseases, such as, but not limited to, asthma, emphysema, and chronic obstructive pulmonary
30   disease.

Panel 4D Summary: See annotation for Panel 4.1D for relevant comments.

Panel CNS_1 Summary: Ag3606 This panel confirms the presence of this gene in the brain. Please see Panel 1.4 for discussion of utility of this gene in the central nervous system.

C. NOV3a (CG59845-01: butyrophilin)

5   Expression of gene CG59845-01 was assessed using the primer-probe set Ag3607, described in Table CA. Results of the RTQ-PCR runs are shown in Table CB.

CNS_neurodegeneration_v1.0 Summary: Ag3607 Expression of the CG59845-01 gene is low/undetectable (CTs > 35) across all of the samples on this panel.

General_screening_panel_v1.4 Summary: Ag3607 Expression of the CG59845-01 gene is low/undetectable (CTs > 35) across all of the samples on this panel.

5 Panel 4.1D Summary: Ag3607 Highest expression of the CG59845-01 gene is seen exclusively in PMA/ionomycin treated LAK cells (CT=33.5). Therefore, expression of this gene can be used in distinguishing this sample from other samples in this panel. LAK cells are involved in tumor immunology and cell clearance of virally and bacterial infected cells as well as tumors. Therefore, modulation of the function of the protein encoded by this gene

10 through the application of a small molecule drug or antibody may alter the functions of these cells and lead to improvement of symptoms associated with these conditions

D. NOV4a (CG59871-01: CVB3 BINDING PROTEIN)

Expression of gene CG59871-01 was assessed using the primer-probe sets Ag3806 and Ag3808, described in Tables DA and DB. Results of the RTQ-PCR runs are shown in Tables

15 DC, DD and DE.

Table DA. Probe Name Ag3806

CNS_neurodegeneration_v1.0 Summary: Ag3806 This panel confirms the expression of the CG59871-01 gene at low levels in the brains of an independent group of individuals. However, no differential expression of this gene was detected between Alzheimer's diseased postmortem brains and those of non-demented controls in this experiment. Please see Panel 1.4 for a discussion of the potential utility of this gene in treatment of central nervous system disorders.

General_screening_panel_v1.4 Summary: Ag3806 Highest expression of the CG59871-01 gene is detected in colon cancer CaCo-2 cell line (CT=26.3). In addition high expression of this gene is also seen in cluster of colon cancer, CNS cancer, gastric cancer, lung cancer, breast and ovarian cancers, sqaumous cell line carcinoma and a melanoma cell lines.

251

Therefore, therapeutic modulation of the activity of this gene or its protein product, through the use of small molecule drugs, might be beneficial in the treatment of these cancers.

Among tissues with metabolic or endocrine function, this gene is expressed at high to moderate levels in pancreas, adipose, adrenal gland, thyroid, pituitary gland, skeletal muscle,

5   heart, liver and the gastrointestinal tract. Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of endocrine/metabolically related diseases, such as obesity and diabetes.

Interestingly, this gene is expressed at much higher levels in fetal (CTs=28) when compared to adult lung and liver samples (CTs=33-35). This observation suggests that expression of

10   this gene can be used to distinguish fetal lung and liver from corresponding adult tissues.

In addition, this gene is expressed at high to moderate levels in all regions of the central nervous system examined, including amygdala, hippocampus, substantia nigra, thalamus, cerebellum, cerebral cortex, and spinal cord. Therefore, this gene may play a role in central nervous system disorders such as Alzheimer's disease, Parkinson's disease, epilepsy, multiple

15   sclerosis, schizophrenia and depression. Furthermore, expression of this gene is higher in fetal (CT=26) as compared to the adult whole brain (CT=29). Therefore, expression of this gene can be used to distinguish fetal from adult brain.

Panel 4.1D Summary: Ag3806 Highest expression of the CG59871-01 gene is detected in colon sample(CT=30). In addition, significant expression of this gene is seen in normal lung,

20   thymus and kidney tissues. Therefore, antibody or small molecule therapies designed with the protein encoded for by this gene could modulate these tissue function and be important in the treatment of inflammatory or autoimmune diseases that affect these tissues such as, lupus and glomerulonephritis, inflammatory bowel diseases, asthma, allergy, COPD and emphysema.

High expression of this gene is also seen in NCI-H292, small airway epithelium,

25   microvascular dermal EC, TNFalpha + IL1beta treated bronchial epithelium, HUVEC, EOL-1 dbcAMP, Ramos (B cells) and activated secondary Tr1 cells. The expression of this gene in cells derived from or within the lung, in activated T and B cells suggests that this gene may be involved in normal conditions, as well as, pathological and inflammatory lung disorders that include chronic obstructive pulmonary disease, asthma, allergy and emphysema.

30   **E. NOV5a (CG59883-01: CVB3 BINDING PROTEIN)**
                                     252

Expression of gene CG59883-01 was assessed using the primer-probe set Ag3625, described in Table EA. Results of the RTQ-PCR runs are shown in Tables EB, and EC.

Table EA. Probe Name Ag3625

CNS_neurodegeneration_v1.0 Summary: Ag3625 Expression of the CG59883-01 gene is low/undetectable in all samples on this panel (CTs>35).

General_screening_panel_v1.4 Summary: Ag3625 Expression of the CG59883-01 gene is restricted to the testis and a brain cancer cell line (CTs=30-32). Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel and as a marker of testicular tissue. Furthermore, therapeutic modulation of the expression or function of this gene product may be useful in the treatment of male infertility and hypogonadism.

256

Panel 4.1D Summary: Ag3625 Expression of the CG59883-01 gene is restricted to a cluster of treated and untreated NCI-H292 mucoepidermoid cells (CTs=32-33). Treatment of these cells does not seem to significantly alter expression of this transcript in this cell line. Thus, the protein could be used to identify certain lung tumors similar to NCI-H292. The encoded protein may also contribute to the normal function of the goblet cells within the lung. Therefore, designing therapeutics to this protein may be important for the treatment of emphysema and asthma as well as other lung diseases in which goblet cells or the mucus they produce have pathological consequences.

F. NOV6a (CG59901-01: Scavenger receptor)

Expression of gene CG59901-01 was assessed using the primer-probe set Ag3627, described in Table FA.

Table FA. Probe Name Ag3627

Primers	Sequences	Length	Start Position	SEQ ID No:
Forward	5'-ggagcagtgactgctgtagaga-3'	22	331	123
Probe	TET-5'-caccctctctggactaccctggtctg-3'-TAMRA	26	356	124
Reverse	5'-agcattcacacgacgtaaatgt-3'	22	388	125

CNS_neurodegeneration_v1.0 Summary: Ag3627 Expression of the CG59901-01 gene is low/undetectable in all samples on this panel (CTs>35).

General_screening_panel_v1.4 Summary: Ag3627 Expression of the CG59901-01 gene is low/undetectable in all samples on this panel (CTs>35).

Panel 4.1D Summary: Ag3627 Expression of the CG59901-01 gene is low/undetectable in all samples on this panel (CTs>35).

G. NOV7a (CG88748-01: cyclic nucleotide-gated channel protein)

Expression of gene CG88748-01 was assessed using the primer-probe set Ag3677, described in Table GA. Results of the RTQ-PCR runs are shown in Tables GB.

Table GA. Probe Name Ag3677

257

CNS_neurodegeneration_v1.0 Summary: Ag3701 Expression of the CG90021-01 gene is low/undetectable in all samples on this panel (CTs>35).

General_screening_panel_v1.4 Summary: Ag3701 Expression of the CG90021-01 gene is restricted to the testis (CT=33). This expression agrees with the charactizeration of this protein as a putative testicular protein. Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker for testicular tissue. Furthermore, therapeutic modulation of the expression or function of this gene product may be useful in the treatment of male infertility and hypogonadism.

Panel 4.1D Summary: Ag3701 Expression of the CG90021-01 gene is restricted to a sample of activated secondary Th1 cells (CT=30.4). Thus, expression of this gene could be used to distinguish this sample from other samples on this panel and as a marker to identify activated Th1 cells. Furthermore, this gene product may be involved in diseases where T cells are chronically stimulated.

I. NOV9a (CG90709-01: Ion Transport Protein)

Expression of gene CG90709-01 was assessed using the primer-probe set Ag3712, described in Table IA.

Table IA. Probe Name Ag3712

Primers	Sequences	Length	Start Position	SEQ ID No:
Forward	5'-gttacacattctgtggctggat-3'	22	1217	132
Probe	TET-5'-tgtcttaggaccataccatctacagtttga-3'-TAMRA	30	1239	133
Reverse	5'-acactcagcaactgtgttcaga-3'	22	1272	134

CNS_neurodegeneration_v1.0 Summary: Ag3712 Expression of the CG90709-01 gene is low/undetectable (CTs > 35) across all of the samples on this panel.

264

General_screening_panel_v1.4 Summary: Ag3712 Results from one experiment with the CG90709-01 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

Panel 4.1D Summary: Ag3712 Expression of the CG90709-01 gene is low/undetectable

5   (CTs > 35) across all of the samples on this panel.

J. NOV9c and NOV9d (CG90709-03 and CG90709-04: Ion Transport Protein)

Expression of gene CG90709-03 and CG90709-04 was assessed using the primer-probe sets Ag5864 and Ag5941, described in Tables JA and JB. Results of the RTQ-PCR runs are

10   shown in Tables JC, JD, JE and JF.

AI_comprehensive panel_v1.0 Summary: Ag5864 Two experiments with different probe and primer sets are in excellent agreements with highest expression of the CG90709-03 gene in matched control ulcerative colitis sample and OA cartilage (CTs=30). Interestingly, expression of this gene is higher in matched control ulcerative colitis and Crohn's sample as compared the sample of corresponding diseased tissue. In addition, significant expression of this gene is also observed in synovium, bone and cartilage samples derived from orthoarthritis and rheumatoid arthritis patient. Therefore, therapeutic modulation of the

activity of this gene may prove useful in the treatment of inflammatory bowel diseases and arthritis.

CNS_neurodegeneration_v1.0 Summary: Ag5864 Expression of the CG90709-03 gene is low/undetectable (CTs > 34) across all of the samples on this panel.

5   **General_screening_panel_v1.5 Summary:** Ag5864 Highest expression of the CG90709-03 gene is detected in melanoma SK-MEL-5 cell line (CT=28.2). High to moderate expression of this gene is also seen in melanoma, renal cancer, squamous cell carcinoma, ovarian and breast cancer, colon cancer and CNS cancer cell lines. Therefore, therapeutic modulation of the activity of this gene or its protein product, through the use of small

10 molecule drugs, or antibodies, might be beneficial in the treatment of these cancers.

Among tissues with metabolic or endocrine function, this gene is expressed at moderate levels in pancreas, adipose, adrenal gland, and the gastrointestinal tract. Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of endocrine/metabolically related diseases, such as obesity and diabetes.

15 The CG90709-03 gene codes for an ion transport protein. Ion transport proteins are responsible for the movement of cations through the membrane. This family contains sodium, potassium and calcium ion channels. The physiologic function of an ion transport protein is determined, in part, by its subcellular localization and by the cellular mechanisms that modulate its activity (Ref.1). Recently, mutations of a gene encoding an ion transport protein,

20 has been shown to be involved in the development of chronic pancreatitis including cystic fibrosis of the pancrease (Ref.2). The CG90709-03 gene is expressed in pancrease at a moderate levels (CT=33). Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of pancreatitis.

In addition, significant expression of this gene is also observed in spleen and thymus.

25 Therefore, antibodies or small molecule therapeutics that block the function of this gene product may be useful as anti-inflammatory therapeutics for the treatment of allergies, autoimmune diseases, and inflammatory diseases.

Dunbar LA, Caplan MJ. (2001) Ion pumps in polarized cells: sorting and regulation of the Na+, K+- and H+, K+-ATPases. J Biol Chem 2001 Aug 10;276(32):29617-20. PMID: 11404365

5　Bornstein JD, Cohn JA. (1999) Cystic fibrosis in the pancreas: recent advances provide new insights. Curr Gastroenterol Rep 1(2):161-5. PMID: 10980944

Panel 4.1D Summary: Ag5864 Highest expression of the CG90709-03 gene is detected in LPS treated monocytes (CT=27). In addition, expression of this gene is low or undectable in resting monocytes (CT=37). Therefore, expression of this gene can be used to distinguish between the treated and resting monocytes. Furthermore, the expression of this gene in LPS

10　treated monocytes, cells that play a crucial role in linking innate immunity to adaptive immunity, suggests a role for this gene product in initiating inflammatory reactions. Therefore, modulation of the expression or activity of this gene through the application of monoclonal antibodies or small molecule may reduce or prevent early stages of inflammation and reduce the severity of inflammatory diseases such as psoriasis, asthma, inflammatory

15　bowel disease, rheumatoid arthritis, osteoarthritis and other lung inflammatory diseases.

Expression of this gene is stimulated in activated primary and secondary Th1,Th2 and Tr1 cells, TNF alpha treated Dermal fibroblast CCD1070 cells, LPS treated macrophages, ionomycin treated Ramos B cells, PWM/CD40L and IL-4 treated B lymphocytes, and PWM/PHA treated PMBC. Therefore, the putative protein encoded by this gene could

20　potentially be used diagnostically to identify activated B or T cells. In addition, the gene product could also potentially be used therapeutically in the treatment of asthma, emphysema, IBD, lupus or arthritis and in other diseases in which T cells and B cells are activated.

Expression of this gene is also stimulated in TNF alpha treated dermal fibroblast CCD1070 (CT=31) as compared to the resting cells (CT=34). Therefore, expression of this gene can be

25　used to distinguish between these treated and resting fibroblast cells. Also, therapeutic modulation of this gene product could be useful in the treatment of skin disorder such as psoriasis.

K. NOV10a (CG90739-01: Neuronal thread protein like)

Expression of gene CG90739-01 was assessed using the primer-probe set Ag3796, described

30　in Table KA. Results of the RTQ-PCR runs are shown in Tables KB, KC, and KD.

CNS_neurodegeneration_v1.0 Summary: Ag3796 This panel does not show differential expression of the CG56153-01 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain, with highest expression in the hippocampus of an Alzheimer's patient (CT=33). Therefore, therapeutic modulation of the expression or

5   function of this gene may be useful in the treatment of neurologic disorders, such as Alzheimer's disease, Parkinson's disease, schizophrenia, multiple sclerosis, stroke and epilepsy.

General_screening_panel_v1.4 Summary: Ag3796 Results from one experiment with the CG90739-01 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

General_screening_panel_v1.5 Summary: Ag3796 Highest expression of the CG90739-
5   01 gene is seen in the testis (CT=27). Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker of testicular tissue. Furthermore, therapeutic modulation of the expression or function of this protein may be effective in the treatment of male infertility or hypogonadism.

In addition, low but significant expression of this gene is seen in many regions of the central
10   nervous system examined, including hippocampus, thalamus, cerebellum, cerebral cortex, and spinal cord. This gene codes for variant of neuronal thread protein-like protein. Neuronal thread protein is a thread protein identified in AD and Down's syndrome brain tissue. The AD-associated neuronal thread protein (AD7c-NTP), a ~41 kD membrane-spanning phosphoprotein, is shown to causes apoptosis and neuritic sprouting in transfected neuronal
15   cells (Ref. 1, 2). Therefore, therapeutic modulation of the expression or function of this gene may be useful in the treatment of neurologic disorders, such as Alzheimer's disease, Parkinson's disease, and Downs syndrome.

See, generally,

de la Monte SM. (1999) Molecular abnormalities of the brain in Down syndrome: relevance
20   to Alzheimer's neurodegeneration. J Neural Transm Suppl;57:1-19. PMID: 10666665

Suzanne M. de la Monte, Jack R. Wands (2001) The AD7C-NTP neuronal thread protein biomarker for detecting Alzheimer's disease. Journal of Alzheimer's Disease Volume 3 (3), 345-353.

Oncology_cell_line_screening_panel_v3.2 Summary: Ag3796 Expression of the
25   CG90739-01 gene is low/undetectable (CTs > 35) across all of the samples on this panel.

Panel 4.1D Summary: Ag3796 Expression of the CG90739-01 gene is highest in secondary Th1/TH2/Tr1 cells treated with anti-CD95 (CT=31.7). Expression of this gene in this panel appears to be mainly associated with hematopoietic cells, including T cells, particularly chronically activated Th1, Th2 and Tr1 cells, LAK cells, macrophages and dendritic cells.

281

Thus, this transcript or the protein it encodes could be used to detect hematopoietically-derived cells. Furthermore, therapeutics designed with the protein encoded by this transcript could be important in the regulation the function of antigen presenting cells (macrophages and dendritic cells)or T cells and be important in the treatment of asthma, emphysema,

5   psoriasis, arthrtis, and IBD.

L. NOV11a and NOV11b (CG91667-01 and CG91667-02: dlk1)

Expression of gene CG91667-01 and CG91667-02 was assessed using the primer-probe set Ag3009, described in Table LA. Results of the RTQ-PCR runs are shown in Tables LB, LC, LD, LE and LF. Please note that CG91667-02 represents a full-length physical clone of the

10   CG91667-01 gene, validating the prediction of the gene sequence.

AI_comprehensive panel_v1.0 Summary: Ag3009 Highest expression of the CG91667-01 gene is seen in bone from an osteoarthritis patient (CT=24.8).

Panel 1.3D Summary: Ag3009 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression of the CG91667-01
5   gene, a DLK1 homolog, in fetal skeletal muscle (CTs=21-22). This expression is in agreement with published data that shows preferential expression of this gene in skeletal muscle.

In addition, this gene is expressed at much higher levels in fetal skeletal muscle when compared to expression in the adult counterpart (CTs=29). Thus, expression of this gene may
10 be used to differentiate between the fetal and adult source of this tissue. Furthermore, the relative overexpression of this gene in fetal skeletal muscle suggests that the protein product may enhance muscular growth or development in the fetus and thus may also act in a regenerative capacity in the adult. Therefore, therapeutic modulation of the protein encoded by this gene could be useful in treatment of muscle related diseases. More specifically,
15 treatment of weak or dystrophic muscle with the protein encoded by this gene could restore muscle mass or function.

This gene is also expressed at much higher levels in fetal liver (CT=25), lung (CT=32) and heart and kidney (CTs=27) when compared to expression in the adult heart (CT=30), lung, liver, and kidney (CTs=40). Thus, expression of this gene could be used to differentiate
20 between the fetal and adult forms of lung, liver, kidney and heart. Dlk1 has been implicated in the cells response to growth and differentiation signals (Ref.1, 2). The prominent expression of this gene in fetal tissues suggests that this Dlk1 homolog may also be involved in cellular growth and proliferation.

There are also high levels of expression of this gene in a liver cancer cell line. In addition,
25 low but significant expression of this gene is associated with lung and CNS cancer. Earlier DLK1 gene has been shown to be differentially expressed in small cell lung carcinoma and neuroendocrine tumor cell line (Ref.3). Therefore, therapeutic modulation of this gene, through the use of small molecule drugs, or antibodies could be of benefit in the treatment of liver, lung and CNS cancers.

See, generally,

Charlier C, Segers K, Wagenaar D, Karim L, Berghmans S, Jaillon O, Shay T, Weissenbach J, Cockett N, Gyapay G, Georges M. Human-ovine comparative sequencing of a 250-kb imprinted domain encompassing the callipyge (clpg) locus and identification of six imprinted
5   transcripts: DLK1, DAT, GTL2, PEG11, antiPEG11, and MEG8. Genome Res 2001 May;11(5):850-62. PMID: 11337479

Baladron V, Jose Ruiz-Hidalgo M, Bonvini E, Gubina E, Notario V, Laborda J.The EGF-like Homeotic Protein dlk Affects Cell Growth and Interacts with Growth-Modulating Molecules in the Yeast Two-Hybrid System. Biochem Biophys Res Commun 2002 Feb 22;291(2):193-
10   204. PMID: 11846389

Laborda J, Sausville EA, Hoffman T, Notario V. (1993) dlk, a putative mammalian homeotic gene differentially expressed in small cell lung carcinoma and neuroendocrine tumor cell line. J Biol Chem 268(6):3817-20. PMID: 8095043

Panel 2D Summary: Ag3009 Two experiments with the same probe and primer set produce
15   results that are in excellent agreement, with highest expression of the CG91667-01 gene in kidney cancer (CTs=25). In addition, this gene is more highly expressed in liver and kidney tumors than in the corresponding matched normal tissue. Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel and as a marker for these cancers. This expression in kidney and liver cancers is in agreement with
20   published reports that Dlk1 may be invovled in the cells response to growth and differentiation signals. Therefore, therapeutic targeting of this gene product with a human monoclonal antibody is anticipated to limit or block the extent of tumor cell growth and metastasis, particularly in kidney and liver tumors.

Panel 3D Summary: Ag3009 Highest expression of the CG91667-01 gene is seen in a
25   rhabdomyosarcoma cell line (CT=25). Significant levels of expression are also seen in cell lines derived from lung cancer, myelogenous leukemia, neuroblastoma, and neuroectodermal tissue. Thus, expression of this gene could be used to differentiate between a rhabdomyosarcoma cell line and other samples on this panel.

This gene codes for delta like protein precursor (DLK), belonging to NOTCH family.
30   Recently, a similar protein DLL4 belonging to NOTCH family has been shown to induces T-

cell leukemia/lymphoma when overexpressed in mice by retroviral-mediated gene transfer (ref.1). Therefore, therapeutic modulation of this gene, through the use of small molecule drugs, or antibodies could be of benefit in the treatment of leukemia, lymphomas, blastomas and sarcomas.

5   *See, generally,*

Yan XQ, Sarmiento U, Sun Y, Huang G, Guo J, Juan T, Van G, Qi MY, Scully S, Senaldi G, Fletcher FA. (2001) A novel Notch ligand, Dll4, induces T-cell leukemia/lymphoma when overexpressed in mice by retroviral-mediated gene transfer. Blood 98(13):3793-9. PMID: 11739188

10   **Panel 4D Summary:** Ag3009 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression of the CG91667-01 gene in treated or untreated samples derived from the KU-812 basophil cell line (CTs=29-30). Low but significant levels of expression are also seen in resting astrocytes, colon, thymus, and kidney. Data from a third experiment with this probe and primer are not included because the

15   amp plot indicates there were experimental difficulties with this run (Run 161701540).

Basophils release histamines and other biological modifiers in reponse to allergens and play an important role in the pathology of asthma and hypersensitivity reactions. Therefore, therapeutics designed against the putative protein encoded by this gene may reduce or inhibit inflammation by blocking basophil function in these diseases. In addition, these cells are a

20   reasonable model for the inflammatory cells that take part in various inflammatory lung and bowel diseases, such as asthma, Crohn's disease, and ulcerative colitis. Therefore, therapeutics that modulate the function of this gene product may reduce or eliminate the symptoms of patients suffering from asthma, Crohn's disease, and ulcerative colitis.

M. NOV12a and NOV12b (CG92293-01 and CG92293-02: Polyprotein

25   **(ovochymase))**

Expression of gene CG92293-01 and CG92293-02 was assessed using the primer-probe sets Ag3775 and Ag5273, described in Tables MA and MB. Results of the RTQ-PCR runs are shown in Tables MC, MD, ME and MF.

AI_comprehensive panel_v1.0 Summary: Ag5273 The CG92293-01 gene appears to be slighly overexpressed in a cluster of samples derived from bone, cartilage, and synovium of rheumatoid arthritis patients (CTs=33-34). This expression profile suggests that therapeutic modulation of this gene product may reduce or eliminate the symptoms of patients suffering from rheumatoid arthritis.

CNS_neurodegeneration_v1.0 Summary: Ag3775 Two experiments with two probe and primer sets produce results that are in excellent agreement. This panel does not show differential expression of the CG92152-01 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain, with highest expression in the hippocampus of an Alzheimer's patient (CTs=31-32). Please see Panel 1.4 for discussion of utility of this gene in the central nervous system.

General_screening_panel_v1.4 Summary: Ag3775 Highest expression of the CG92152-01 gene is seen in an ovarian cancer cell line (CT=32). significant levels of expression are seen in a cluster of samples derived from breast and lung cancer cell lines. Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel and as a marker to detect the presence of these cancers. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of ovarian, breast and lung cancers.

This gene is also expressed at low levels in the CNS, including the hippocampus, thalamus, substantia nigra, amygdala, cerebellum and cerebral cortex. Therefore, therapeutic modulation of the expression or function of this gene may be useful in the treatment of neurologic disorders, such as Alzheimer's disease, Parkinson's disease, schizophrenia,

5   multiple sclerosis, stroke and epilepsy.

Among tissues with metabolic function, this gene is expressed at low but significant levels in adipose, adrenal gland, pancreas, heart and adult and fetal skeletal muscle. This expression among these tissues suggests that this gene product may play a role in normal neuroendocrine and metabolic and that disregulated expression of this gene may contribute to neuroendocrine

10   disorders or metabolic diseases, such as obesity and diabetes.

Panel 4.1D Summary: Ag3775 Highest expression of the CG92152-01 gene in IL-4 treated with dermal fibroblasts (CTs=32.5). Low, but significant levels of expression are also seen in treated and untreated lung and dermal fibroblasts, and chronically activated Th2 cells. The expression of this gene in lung and skin derived fibroblasts suggests that this gene may be

15   involved in normal conditions as well as pathological and inflammatory lung disorders that include chronic obstructive pulmonary disease, asthma, allergy, psoriasis, and emphysema.

N. NOV15a (CG92531-01: LEUCINE RICH)

Expression of gene CG92531-01 was assessed using the primer-probe set Ag3839, described in Table NA. Results of the RTQ-PCR runs are shown in Tables NB, NC and ND.

CNS_neurodegeneration_v1.0 Summary: Ag3839 This panel confirms the expression of CG92531-01 gene at low levels in the brains of an independent group of individuals. However, no differential expression of this gene was detected between Alzheimer's diseased postmortem brains and those of non-demented controls in this experiment. Please see Panel 1.4 for a discussion of the potential utility of this gene in treatment of central nervous system disorders.

General_screening_panel_v1.4 Summary: Ag3839 Highest expression of the CG92531-01 gene is detected in CNS cancer (glio/astro) cell line U-118-MG (CT=31.3). Significant expression of this gene is seen in cluster of cancer cell lines (CNS, colon, gastric, lung, breast, ovarian, prostate and melanoma) used in this panel. Therefore, therapeutic modulation of the activity of this gene or its protein product, through the use of small molecule drugs, or antibodies, might be beneficial in the treatment of these cancers.

Among tissues with metabolic or endocrine function, this gene is expressed at low to moderate levels in pancreas, adipose, adrenal gland, thyroid, skeletal muscle, heart, liver and the gastrointestinal tract. Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of endocrine/metabolically related diseases, such as obesity and diabetes.

311

Interestingly, expression of this gene is higher in adult (CT=33) compared to the fetal heart sample (CT=36). Thus, expression of this gene can be used to distinguish between the adult and fetal heart.

In addition, this gene is expressed at low to moderate levels in all regions of the central

5   nervous system examined, including amygdala, hippocampus, substantia nigra, thalamus, cerebellum, cerebral cortex, and spinal cord. Therefore, this gene may play a role in central nervous system disorders such as Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia and depression.

Panel 4.1D Summary: Ag3839 Highest expression of the CG92531-01 gene is detected

10   TNFalpha + IL-1beta treated lung microvascular EC (CT=32). In addition, this gene is expressed at high to moderate levels in a wide range of cell types of significance in the immune response in health and disease. These cells include members of the T-cell, B-cell, endothelial cell, macrophage/monocyte, and peripheral blood mononuclear cell family, as well as epithelial and fibroblast cell types from lung and skin, and normal tissues represented

15   by colon, lung, thymus and kidney. This ubiquitous pattern of expression suggests that this gene product may be involved in homeostatic processes for these and other cell types and tissues. This pattern is in agreement with the expression profile in General_screening_panel_v1.4 and also suggests a role for the gene product in cell survival and proliferation. Therefore, modulation of the gene product with a functional therapeutic

20   may lead to the alteration of functions associated with these cell types and lead to improvement of the symptoms of patients suffering from autoimmune and inflammatory diseases such as asthma, allergies, inflammatory bowel disease, lupus erythematosus, psoriasis, rheumatoid arthritis, and osteoarthritis.

O. NOV16a and NOV16b (CG92715-01 and CG92715-02: LRR protein)

25   Expression of gene CG92715-01 and CG92715-02 was assessed using the primer-probe set Ag2502, described in Table OA. Results of the RTQ-PCR runs are shown in Tables OB, OC, OD, OE and OF.

CNS_neurodegeneration_v1.0 Summary: Ag2502 This panel does not show differential expression of the CG92715-01 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain, with highest expression in the hippocampus from an Alzheimer's patient (CT=26.9). Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

Panel 1.3D Summary: Ag2502 Highest expression of the CG92715-01 gene is seen in the cerebral cortex (CT=27). In addition, low levels of expression are seen in all CNS regions

examined in this panel. This gene encodes a leucine-rich repeat protein. Leucine rich repeats

(LRR) mediate reversible protein-protein interactions and have diverse cellular functions,

including cellular adhesion and signaling. Several of these proteins, such as connectin, slit,

chaoptin, and Toll have pivotal roles in neuronal development in Drosophila and may play

5   significant but distinct roles in neural development and in the adult nervous system of

humans (Ref. 1). In Drosophilia, the LRR region of axon guidance proteins has been shown

to be critical for their function (especially in axon repulsion). Since the leucine-rich-repeat

protein encoded by this gene shows high expression in the cerebral cortex, it is an excellent

candidate neuronal guidance protein for axons, dendrites and/or growth cones in general.

10   Therefore, therapeutic modulation of the levels of this protein, or possible signaling via this

protein, may be of utility in enhancing/directing compensatory synaptogenesis and fiber

growth in the CNS in response to neuronal death (stroke, head trauma), axon lesion (spinal

cord injury), or neurodegeneration (Alzheimer's, Parkinson's, Huntington's, vascular dementia

or any neurodegenerative disease).

15   Moderate levels of expression are also seen in cell lines derived from ovarian cancer, lung

cancer, and brain cancer. Therefore, therapeutic modulation of the expression or function of

this gene product may be effective in the treatment of these cancers.

Among metabolically relevant tissues, this gene expression is seen in fetal skeletal muscle,

thyroid, and pituitary gland. This observation suggests that therapeutic modulation may aid

20   the treatment of metabolic diseases such as obesity and diabetes as well as neuroendocrine

disorders. Glycoprotein hormones influence the development and function of the ovary, testis

and thyroid by binding to specific high-affinity receptors. Interestingly, the extracellular

domains of these receptors are members of the leucine-rich repeat (LRR) protein superfamily

and are responsible for the high-affinity binding.

25   Results from a second experiment with the same probe and primer set are not included (Run

165518160). The amp plot indicates that there were experimental difficulties with this run.

See, generally,

5   Itoh A., Miyabayashi T., Ohno M., Sakano S. 1998 Cloning and expressions of three mammalian homologues of Drosophila slit suggest possible roles for Slit in the formation and maintenance of the nervous system. Brain Res. Mol. Brain Res. 62: 175-186. PMID: 9813312

Panel 2D Summary: Ag2502 Two experiments with the same probe and primer set produce

10 results that are in excellent agreement. Highest expression of the CG92715-01 gene is seen in kidney cancer (CTs=27.7). In addition, expression is significantly higher in the kidney cancer when compared to expression in the normal adjacent tissue, suggesting a role in renal cancer progression. There is also moderate to low expression in bladder, gastric, colon and ovarian cancers. Thus, expression of this gene could be used to differentiate the kidney cancer

15 samples from other samples on this panel and as a marker for kidney cancer. Furthermore, therapeutic targeting of the CG92715-01 gene with a human monoclonal antibody is anticipated to limit or block the extent of tumor cell migration, invasion, and metastasis, specifically in kidney, ovarian, bladder, gastric, and colon tumors.

Panel 3D Summary: Ag2502 Highest expression of the CG92715-01 gene is seen in a lung

20 cancer cell line (CT=28). In addition, moderate levels of expression are seen in a cluster of lung and brain cancer cell lines. Prominent expression is also seen in cerebellum, in agreement with expression seen in Panel 1.3D. Low, but significant expression is also seen in kidney cancer and ovarian cancer cell lines. Thus, expression of this gene could be used to differentiate lung and brain cancer cell lines and normal brain from other samples on this

25 panel and as a marker for lung and brain cancer. In addition, moderate expression of this gene is also seen in melanoma, rhabdomyosarcoma, osteosarcoma, renal and bladder carcinoma, lymphoma, ovarian and cervical cancer and gastric cancer cell lines. Therefore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of these cancers.

Panel 4D Summary: Ag2502 Ag2502 Highest expression of the CG92715-01 gene is seen in eosinophils (CT=32). Furthermore, differential gene expression is observed in the eosinophil cell line EOL-1 under resting conditions over that in EOL-1 cells stimulated by phorbol ester and ionomycin (CT=34.4). Thus, this gene may be involved in eosinophil

5   function. Antibodies raised against this protein that stimulate its activity may be useful in reduction of eosinophil activation and may therefore be useful therapeutic antibodies for asthma and allergy and as an anti-inflammatory therapeutics for T cell-mediated autoimmune and inflammatory diseases. Low but significant levels of expression are also seen in a cluster of treated and untreated NCI-H292 mucoepidermoid cells adn in normal colon, lung and

10   thymus. This pattern of restricted expression suggests that this gene may be involve in the normal homeostasis of these tissues and/or pathological/inflammatory conditions of the lung.

P. NOV17a (CG92813-01: Cadherin-related tumor suppressor precursor (FAT))

Expression of gene CG92813-01 was assessed using the primer-probe sets Ag1350, Ag1413,

15   Ag1414, Ag1515, Ag3085, Ag693, Ag694, Ag740 and Ag3819, described in Tables PA, PB, PC, PD, PE, PF, PG, PH and PI. Results of the RTQ-PCR runs are shown in Tables PJ, PK, PL, PM, PN, PO, PP, PQ and PR.

CNS_neurodegeneration_v1.0 Summary: Ag1413/Ag3819/Ag693 Three experiment with different primer and probe sets are in excellent agreement. This panel confirms the expression of the CG92813-01 gene at low levels in the brain in an independent group of individuals. However, no differential expression of this gene was detected between Alzheimer's diseased

5 postmortem brains and those of non-demented controls in this experiment. Please see Panel 1.4 for a discussion of the potential utility of this gene in treatment of central nervous system disorders.

General_screening_panel_v1.4 Summary: Ag1413/Ag3819 Two experiment with different primer and probe sets are in excellent agreement, with highest expression of the

10 CG92813-01 gene in lung cancer cell line NCI-H23 (CT=26-28). High to moderate levels of expression of this gene is also seen in cluster of CNS cancer, renal cancer, lung cancer, breast cancer, ovarian cancer and melanoma cell lines. Therefore, therapeutic modulation of the activity of this gene or its protein product, through the use of small molecule drugs, protein therapeutics or antibodies, might be beneficial in the treatment of lung cancer or ovarian

15 cancer. The CG92813-01 gene codes for cadherin-related tumor suppressor precursor. E-cadherin, a related protein is used as a prognostic marker for breast cancer detection (Ref. 1). Therefore, expression of CG92813-01 gene can also be used as diagnostic marker in the above mentioned cancers.

Among tissues with metabolic or endocrine function, this gene is expressed at high to

20 moderate levels in pancreas, adipose, adrenal gland, thyroid, pituitary gland, skeletal muscle, heart, liver and the gastrointestinal tract. Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of endocrine/metabolically related diseases, such as obesity and diabetes. In addition, E cadherin, a related protein is shown to be reduced in small intestinal mucosa of coeliac sprue disease (Ref.1), a sample not used in this panel. In

analogy to E cadherin, we predict that expression of the CG92813-01 gene may also be reduced in this tissue of coeliac sprue disease. Coeliac sprue is a chronic disease, in which there is a characteristic mucosal lesion of the small intestine and impaired nutrient absorption, which improves upon the withdrawal of wheat gliadins and related grain proteins from the

5   diet. Biopsy specimens demonstrate diffuse enteritis with pronounced atrophy or total loss of villi. Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of coelic sprue disease.

In addition, this gene is expressed at low to moderate levels in all regions of the central nervous system examined, including amygdala, hippocampus, substantia nigra, thalamus,

10   cerebellum, cerebral cortex, and spinal cord. This gene product is a transmembrane glycoproteins belonging to the cadherin superfamily of molecules, which are involved in many biological processes such as cell adhesion, cytoskeletal organization and morphogenesis. Cadherins can act as axon guidance and cell adhesion proteins, specifically during development and in the response to injury (ref 2). Therefore, manipulation of levels of

15   this protein may be of use in inducing a compensatory synaptogenic response to neuronal death in Alzheimer's disease, Parkinson's disease, Huntington's disease, spinocerebellar ataxia, progressive supranuclear palsy, ALS, head trauma, stroke, or any other disease/condition associated with neuronal loss.

Ag740 Results from one experiment with this gene are not included. The amp plot indicates

20   that there were experimental difficulties with this run.

See, generally,

Barshack I, Goldberg I, Chowers Y, Weiss B, Horowitz A, Kopolovic J. (2001) Immunohistochemical analysis of candidate gene product expression in the duodenal epithelium of children with coeliac sprue. J Clin Pathol 54(9):684-8. PMID: 11533074

25   Ranscht B. (2000) Cadherins: molecular codes for axon guidance and synapse formation. Int. J. Dev. Neurosci. 18: 643-651. PMID: 10978842

Panel 1.2 Summary: Ag694 Two experiment with same primer and probe sets are in excellent agreement, with high expression of the CG92813-01 gene in neuroblastoma metastasis SK-N-AS, and two of the lung cancer (NCI-H23, HOP-62) cell lines (CT=26-28).

30   High to moderate levels of expression of this gene is also seen in cluster of CNS cancer, renal

cancer, lung cancer, breast cancer, ovarian cancer and melanoma cell lines. Significant expression of this gene is also seen in tissues with metabolic or endocrine function and all regions of the central nervous system examined. Please see Panel 1.4 for a discussion of the potential utility of this gene.

5   Ag693 Highest expression of this gene is detected in fetal brain (CT=28.5). Expression of this gene is restricted to some of the brain region, endothelial cells, bladder, liver, and a lung cancer NCI-H23 cell line (CTs=28-32). Thus, expression of this gene can be used to distinguish these samples from other samples used in this panel. Please note that this primer and probe set recognizes a different region of the gene and shows a different expression

10   pattern.

Panel 1.3D Summary: Ag3085 Highest expression of the CG92813-01 gene is detected in fetal brain (CT=28). High to moderate levels of expression of this gene is also seen in cluster of CNS cancer, renal cancer, lung cancer, breast cancer, ovarian cancer and melanoma cell lines. Significant expression of this gene is also seen in tissues with metabolic or endocrine

15   function and all regions of the central nervous system examined. Please see Panel 1.4 for a discussion of the potential utility of this gene.

Panel 2.2 Summary: Ag3085 Highest expression of the CG92813-01 gene is detected in normal uterus (CT=30). High to moderate levels of expression of this gene is also seen in both normal and cancer tissues. Interestingly, expression of this gene is higher in control

20   margin samples of colon, ovary, lung (OD04237-02), liver (ODO4310), kidney (OD04348; 8120614) as compared to their corresponding cancer tissue. Please see Panel 1.4 for a discussion of the potential utility of this gene.

Panel 2D Summary: Ag1413/Ag740 Highest expression of the CG92813-01 gene is detected in normal Kidney and colon (CTs=29-30). Two experiments with different primer

25   and probe sets are in good agreement, with significant expression of this gene in both normal and cancer tissues. Interestingly, expression of this gene is higher in control margin samples of colon (ODO3920), liver (ODO4310), and ovary (OD04768-08) as compared to their corresponding cancer tissue. Please see Panel 1.4 for a discussion of the potential utility of this gene.

Panel 4.1D Summary: Ag1413/Ag3819/Ag740 Three experiments with different probe and primer sets are in excellent agreement, with highest expression of the CG92813-01 gene in ·IFN gamma treated HUVEC cells (CT=25-27). In addition, high to moderate expression of this gene is seen in treated and untreated HUVEC, lung microvascular EC, microvascular

5 dermal EC, Bronchial epithelium, small airway epithelium, NCI-H292, HPAEC, lung fibroblasts, and dermal fibroblasts. The expression of this gene in cells derived from or within the lung suggests that this gene may be involved in normal conditions as well as pathological and inflammatory lung disorders that include chronic obstructive pulmonary disease, asthma, allergy and emphysema.

10 In addition, high expression of this gene is also detected in normal tissues represented by colon, lung, thymus and kidney. Therefore, therapeutic modulation of the activity of the protein encoded by this gene may be useful in the treatment of inflammatory disease affecting these tissues such as inflammatory bowel disease, chronic obstructive pulmonary disease, asthma, allergy, emphysema, lupus and glomerulonephritis.

15 **Panel 4D Summary:** Ag1515/Ag3085 Two experiments with different probe and primer sets are in excellent agreement, with highest expression of the CG92813-01 gene in IFN gamma treated HUVEC cells (CT=25-27). In addition, high to moderate expression of this gene is seen in treated and untreated HUVEC, lung microvascular EC, microvascular dermal EC, Bronchial epithelium, small airway epithelium, NCI-H292, HPAEC, lung fibroblasts,

20 and dermal fibroblasts. The expression of this gene in cells derived from or within the lung suggests that this gene may be involved in normal conditions as well as pathological and inflammatory lung disorders that include chronic obstructive pulmonary disease, asthma, allergy and emphysema.

Interestingly, expression of this gene is higher in untreated HPAEC (CTs=27-28) as

25 compared to TNF alpha + IL-1 beta treated cells (CTs=30-31). Thus, expression of this gene can be used to distinguish the treated from untreated HPAEC samples.

In addition, high expression of this gene is also detected in normal tissues represented by colon, lung, thymus and kidney. Interestingly, expression of this gene is much lower in colon samples from patients with IBD colitis and Crohn's disease relative CTs=31-33) to normal

30 colon (CTs=28-29). Therefore, therapeutic modulation of the activity of the protein encoded by this gene may be useful in the treatment of inflammatory bowel disease.

Panel CNS_1 Summary: Ag693 This panel confirms the expression of the CG92813-01 gene at low levels in the brains of an independent group of individuals. Please see panel 1.4 for a discussion of the potential utility of this gene in treatment of central nervous system disorders.

5   **Q. NOV19a (CG93088-01: moncarboxylate transporter)**

Expression of gene CG93088-01 was assessed using the primer-probe set Ag3841, described in Table QA. Results of the RTQ-PCR runs are shown in Tables QB, QC, and QD.

Table QA. Probe Name Ag3841

CNS_neurodegeneration_v1.0 Summary: Ag3841 Two experiments with same probe and primer sets are in excellent agreements. It confirms the expression of the CG93088-01 gene at low levels in the brain in an independent group of individuals. This gene is upregulated in the temporal cortex of Alzheimer's disease patients when compared with non-demented controls (p = 0.02 when analyzed by Ancova, estimate of total cDNA loaded per well used asa covariate). This gene may therefore be a small molecule target, and blockade of this transporter may slow or stop the progression of Alzheimer's disease.

General_screening_panel_v1.4 Summary: Ag3841 Highest expression of the CG93088-01 gene is detected in adrenal gland (CT=25). In addition, this gene is also expressed at high to moderate levels in other tissues with metabolic or endocrine function, such as pancreas, adipose, thyroid, pituitary gland, skeletal muscle, heart, liver and the gastrointestinal tract.

5   The CG93088-01 gene codes for monocarboxylate transporter, a transporter belonging to sugar transporter family. Recently, a protein belonging to this family was shown to be associated with non-insulin-dependent diabetes mellitus (NIDDM) (Ref.1). Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of endocrine/metabolically related diseases, such as obesity and diabetes including NIDDM.

10   Interestingly, this gene is expressed at much higher levels in fetal (CT=28.7) when compared to adult liver (CT=35.6). This observation suggests that expression of this gene can be used to distinguish fetal from adult liver.

In addition, this gene is expressed at high to moderate levels in all regions of the central nervous system examined, including amygdala, hippocampus, substantia nigra, thalamus,
15   cerebellum, cerebral cortex, and spinal cord. Therefore, this gene may play a role in central nervous system disorders such as Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia and depression.

See, generally,

McVie-Wylie AJ, Lamson DR, Chen YT. (2001) Molecular cloning of a novel member of the
20   GLUT family of transporters, SLC2a10 (GLUT10), localized on chromosome 20q13.1: a candidate gene for NIDDM susceptibility. Genomics 72(1):113-7. PMID: 11247674

Panel 2.2 Summary: Ag3841 Results from one experiment with the CG93088-01 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

Panel 4.1D Summary: Ag3841 Highest expression of the CG93088-01 gene is detected in
25   kidney sample (CT=26). Therefore, antibody or small molecule therapies designed with the protein encoded for by this gene could modulate kidney function and be important in the treatment of inflammatory or autoimmune diseases that affect the kidney, including lupus and glomerulonephritis.

In addition, low to moderate expression of this gene is also seen in TNF alpha + IL-1 beta
treated HPAEC, keratinocytes, basophils, astrocytes, coronery artery SMC, small airway
epithelium, lung microvascular EC, microvascular dermal EC and PWM treated B
lymphocytes. Interestingly, expression of this gene is stimulated in TNF alpha + IL-1 beta
5   treated HPAEC, IFN gamma/IL-11 treated HUVEC cells, PWM treated PBMC cells, IL-2+
IL-18 treated LAK cells, activated primary and secondary Th1, Th2, Tr1 cells as compared to
their corresponding untreated or resting cells. Therefore, modulation of the gene product with
a functional therapeutic may lead to the alteration of functions associated with these cell
types and lead to improvement of the symptoms of patients suffering from autoimmune and
10 inflammatory diseases such as asthma, allergies, inflammatory bowel disease, lupus
erythematosus, psoriasis, rheumatoid arthritis, and osteoarthritis.

R. NOV21a (CG93345-01: GPCR)

Expression of gene CG93345-01 was assessed using the primer-probe set Ag3850, described
in Table RA. Results of the RTQ-PCR runs are shown in Tables RB.

CNS_neurodegeneration_v1.0 Summary: Ag3850 Expression of the CG93345-01 gene is low/undetectable in all samples on this panel (CTs>35).

General_screening_panel_v1.4 Summary: Ag3850 Expression of the CG93345-01 gene is restricted to a sample derived from a lung cancer cell line (CT=31.1). Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of lungcancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of lung cancer.

Panel 4.1D Summary: Ag3850 Expression of the CG93345-01 gene is low/undetectable in all samples on this panel (CTs>35).

S. NOV22a (CG93400-01: GPCR)

CNS_neurodegeneration_v1.0 Summary: Ag3853 Expression of the CG93400-01 gene is low/undetectable in all samples on this panel (CTs>35).

General_screening_panel_v1.4 Summary: Ag3853 Expression of the CG93400-01 gene is restricted to a sample derived from a lung cancer cell line (CT=31). Thus, expression of this

5   gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of lung cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of lung cancer.

Panel 4.1D Summary: Ag3853 Expression of the CG93400-01 gene is restricted to a sample derived from IL-2 treated NK cells (CT=31.5). Thus, expression of this gene may be

10   used to differentiate between this sample and other samples on this panel and as a marker of activated NK cells.

T. NOV23a (CG93410-01: GLUTAMATE RECEPTOR 5)

Expression of gene CG93410-01 was assessed using the primer-probe set Ag1682, described
in Table TA. Results of the RTQ-PCR runs are shown in Tables TB and TC.

Table TA. Probe Name Ag1682

Panel 1.3D Summary: Ag1682 Two experiments with same probe and primer set are in excellent agreement with highest expression of this gene in lung cancer SHP-77 cell line (CTs=26). In addition, low to moderate expression of this gene is also observed in number of cancer cell lines (melanoma, ovarian, breast, lung, renal, colon, CNS and liver

5   adenocarcinoma). Therefore, therapeutic modulation of the activity of this gene or its protein product, through the use of small molecule drugs, protein therapeutics or antibodies, might be beneficial in the treatment of these cancers.

In addition, this gene is expressed at high to moderate levels in all regions of the central nervous system examined, including amygdala, hippocampus, substantia nigra, thalamus,

10   cerebellum, cerebral cortex, and spinal cord. Therefore, this gene may play a role in central nervous system disorders such as Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia and depression. CG93410-01 codes for a splice variant of glutamate receptor 5 (GluR5). Mutation or allelic variation in GluR5 has been shown to be associated with familial amyotrophic lateral sclerosis (ALS) (Ref.1) and Juvenile absence epilepsy

15   (JAE)(Ref.2). Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of ALS and JAE.

Among tissues with metabolic or endocrine function, this gene is expressed at high to moderate levels in pancreas, adrenal gland, fetal skeletal muscle, fetal heart, fetal liver and

370

the gastrointestinal tract. Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of endocrine/metabolically related diseases, such as obesity and diabetes.

Interestingly, this gene is expressed at much higher levels in fetal (CT = 30-33) when
5   compared to adult skeletal muscle, heart and liver (CT > 35). This observation suggests that expression of this gene can be used to distinguish these fetal from adult tissue.

See, generally,

Eubanks JH, Puranam RS, Kleckner NW, Bettler B, Heinemann SF, McNamara JO. (1993) The gene encoding the glutamate receptor subunit GluR5 is located on human chromosome
10   21q21.1-22.1 in the vicinity of the gene for familial amyotrophic lateral sclerosis. Proc Natl Acad Sci U S A 90(1):178-82. PMID: 8419920

Sander T, Hildmann T, Kretz R, Furst R, Sailer U, Bauer G, Schmitz B, Beck-Mannagetta G, Wienker TF, Janz D. (1997). PMID: 9259378

Panel 2D Summary: Ag1682 Two experiments with same probe and primer set are in
15   excellent agreement with highest expression of this gene in lung malignant cancer (OD03126) (CTs=28-31). In addition, expression of this gene is seen in both normal, control margin and cancer tissue. Please see Panel 1.4 for a discussion of the potential utility of this gene.

U. NOV24a (CG93722-01: SERINE PROTEASE HEPSIN)

20   Expression of gene CG93722-01 was assessed using the primer-probe sets Ag1299, Ag897, Ag898 and Ag228, described in Tables UA, UB, UC and UD. Results of the RTQ-PCR runs are shown in Tables UE, and UF.

Panel 1 Summary: Ag228 Expression of the CG93722-01 gene is detected exclusively in testis. Thus, expression of this gene can be used to distinguish testis from other samples used in this panel. Therefore, therapeutic modulation of the activity of the serine protease encoded by this gene may be useful in the treatment of fertility and hypogonadism.

5   **Panel 1.3D Summary:** Ag898 Expression of the CG93722-01 gene is detected exclusively in testis. Thus, expression of this gene can be used to distinguish testis from other samples used in this panel. Therefore, therapeutic modulation of the activity of the serine protease encoded by this gene may be useful in the treatment of fertility and hypogonadism.

Panel 4D Summary: Ag1299 Expression of the CG93722-01 gene is low/undetectable (CTs
10   > 35) across all of the samples on this panel.

V. NOV25a, NOV25b, and NOV25c (CG93858-01 and CG93858-02 and CG56914-03: Fibulin 6 like)

Expression of gene CG93858-01 and varinats CG93858-02 and CG56914-03 was assessed using the primer-probe sets Ag1315b, Ag1316b, Ag1924, Ag900, Ag3960, and Ag4338. In
15   addition expression of gene CG93858-02 was also assessed using the primer-probe sets Ag343, Ag3108, Ag771, Ag772, Ag3899 with CG56914-03 corresponding to Ag3108 and Ag3899 only. The probes are described in Tables VA, VB, VC, VD, VE, VF, VG, VH, VI, VJ and VK. Results of the RTQ-PCR runs are shown in Tables VL, VM, VN, VO, VP, VQ, and VR.

CNS_neurodegeneration_v1.0 Summary: Ag3899/Ag3960/Ag4338/Ag772 Expression of the CG94013-01 gene is low/undetectable (CTs > 34) across all of the samples on this panel.

General_screening_panel_v1.4 Summary: Ag3899/Ag3960/Ag4338 Results of three experiments with two different primer and probe sets are in excellent agreement, with highest expression of the CG94013-01 gene in CNS cancer (astro) SNB-75 cell line (CTs=23-26). In addition, high expression of this gene is seen in CNS cancer cell lines, colon cancer tissue, renal cancer cell line UO-31, breast cancer and melanoma cell lines. Therefore, expression of this gene can be used to distinguish these samples from other samples in the panel and also as marker for detection of these cancers. In addition, therapeutic modulation of the activity of this gene or its protein product, through the use of small molecule drugs, protein therapeutics or antibodies, might be beneficial in the treatment of these cancers.

Among tissues with metabolic or endocrine function, this gene is expressed at low to moderate levels in pancreas, adipose, adrenal gland, thyroid, pituitary gland, skeletal muscle, heart, liver and the gastrointestinal tract. Therefore, therapeutic modulation of the activity of this gene may prove useful in the treatment of endocrine/metabolically related diseases, such as obesity and diabetes.

Interestingly, this gene is expressed at much higher levels in fetal liver (CTs=31-32) and lung (CTs=28) when compared to corresponding adult tissue(CTs=33-35). This observation suggests that expression of this gene can be used to distinguish these fetal tissues from corresponding adult tissues.

Panel 1 Summary: Ag343 Highest expression of the CG94013-01 gene is detected in breast cancer MDA-N cell line (CTs=26). In addition high expression of this gene is also observed

in melanoma, astrocytoma, and lung cance cell lines. Please see panel 1.4 for the utility of this gene.

Panel 1.2 Summary: Ag771/Ag772 Two experiments produce results that are in excellent agreement, with highest expression of this gene in a melanoma cell line (CTs=25). High
5   levels of expression are also seen in clusters of samples from melanoma, breast and brain cancer cell lines. Thus, expression of this gene could be used to differentiate between the melanoma sample and other samples on this panel and as a marker to detect the presence of these cancers. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of melanoma, breast and brain cancers. Data from a third
10 experiment with Ag772 are not included. The results suggest that there were experimental difficulties with this run.

Panel 1.3D Summary: Ag3108 Highest expression of the CG94013-01 gene is detected in melanoma (met) Hs688(B).T cell line (CT=27). In addition, expression of this gene is also seen in melanoma, breast cancer, lung cancer, astrocytoma cell lines and colon cancer well to
15 moderately differentiated (ODO3866) tissue. Please see panel 1.4 for the utility of this gene.

Panel 2.1 Summary: Ag3108 Highest expression of the CG94013-01 gene is detected in melanoma metastasis sample (CT=29). In addition, expression of this gene is higher in metastasis breast cancer (OD04590-03) (CT=33) as compared to breast cancer (OD04590-01) (CT=36.7). Thus, expression of this gene can be used to distinguish these two samples from
20 each other and also as marker for cancer metastasis. Please see panel 1.4 for further utility of this gene.

Panel 4.1D Summary: Ag3899/Ag3960/Ag4338 Results of three experiments with two different primer and probe sets are in excellent agreement, with highest expression of the CG94013-01 gene in lung (CT=30-31). In addition, significant expression of this gene is seen
25 in HUVEC cells, lung fibroblast and dermal fibroblasts. Therefore, antibody or small molecule therapies designed with the protein encoded for by this gene could be important in the treatment of inflammatory lung disorders such as chronic obstructive pulmonary disease, asthma, allergy and emphysema and skin disorders including psoriasis.

In addition, low expression of this gene is also seen in kidney. Therefore, antibody or small
30 molecule therapies designed with the protein encoded for by this gene could modulate kidney

function and be important in the treatment of inflammatory or autoimmune diseases that affect the kidney, including lupus and glomerulonephritis.

Results from one experiment with probe and primer set Ag772 are not included. The amp plot suggests that there were experimental difficulties with this run.

5 **Panel 4D Summary:** Ag3108 Highest expression of the CG94013-01 gene in lung (CT=28.6). In addition, significant expression of this gene is seen in HPAEC cells, HUVEC cells, lung fibroblast,TNFalpha + IL1beta treated bronchial epithelium and dermal fibroblasts. Therefore, antibody or small molecule therapies designed with the protein encoded for by this gene could be important in the treatment of inflammatory lung disorders

10 such as chronic obstructive pulmonary disease, asthma, allergy and emphysema and skin disorders including psoriasis.

In addition, low expression of this gene is also seen in kidney and colon. Therefore, antibody or small molecule therapies designed with the protein encoded for by this gene be important in the treatment of inflammatory or autoimmune diseases that affect the kidney, including

15 lupus and glomerulonephritis, as well as, inflammatory bowel diseases such as Crohns.

Interestingly, expression of this gene is stimulated in PMA/ionomycin treated basophils (CT=30) as compared to resting basophils (CT=36). Basophils release histamines and other biological modifiers in reponse to allergens and play an important role in the pathology of asthma and hypersensitivity reactions. Therefore, therapeutics designed against the putative

20 protein encoded by this gene may reduce or inhibit inflammation by blocking basophil function in these diseases. In addition, these cells are a reasonable model for the inflammatory cells that take part in various inflammatory lung and bowel diseases, such as asthma, Crohn's disease, and ulcerative colitis. Therefore, therapeutics that modulate the function of this gene product may reduce or eliminate the symptoms of patients suffering

25 from asthma, Crohn's disease, and ulcerative colitis.

Ag1924 Results from one experiment with the CG94013-01 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

W. NOV26a (CG93871-01: Fibullin)

396

Expression of gene CG93871-01 was assessed using the primer-probe sets Ag1294b, Ag746 and Ag905, described in Tables WA, WB and WC. Results of the RTQ-PCR runs are shown in Tables WD, WE, WF, WG, WH and WI.

AI_comprehensive panel_v1.0 Summary: Ag1294b Expression of the CG93871-01 gene in this panel confirms expression of this gene in cells involved in the immune response. Highest expression of this gene is seen in normal lung (CT=30.5). Please see Panel 4D for discussion of utility of this gene in inflammation.

5   **CNS_neurodegeneration_v1.0 Summary:** Ag1294b This panel does not show differential expression of the CG56153-01 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Therefore, therapeutic modulation of the expression or function of this gene may be useful in the treatment of neurologic disorders, such as Alzheimer's disease, Parkinson's disease, schizophrenia, multiple sclerosis, stroke and
10   epilepsy.

Panel 1.2 Summary: Ag746 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression of the CG93871-01 gene in a liver cancer cell line (CTs=27). High levels of expression are also seen in fetal and adult liver tissue, a colon cancer cell line and a lung cancer cell line. Thus, expression of this gene could
15   be used to differentiate liver derived samples, the colon cancer cell line and the lung cancer cell line from other samples on this panel. Expression of this gene could also be used as a diagnostic marker to detect the presence of colon and lung cancers.

Moderate expression is also seen in the fetal brain, placenta, and endothelial cells.

Panel 2D Summary: Ag746 Two experiments with the same probe and primer set produce
20   results that are in excellent agreement, with highest expression of the CG93871-01 gene in liver cancer (CTs=31). The prominent expression in liver derived tissue is consistent with the results in Panel 1.2. Moderate levels of expression are also evident in samples from ovarian cancer and kidney cancer. Furthermore, expression of this gene is higher in these cancers than in the normal adjacent tissue. Thus, expression of this gene could be used to differentiate
25   between liver derived samples and other samples on this panel and as a marker to detect the presence of liver, kidney, and ovarian cancer. Furthermore, therapeutic modulation of the

410

expression or function of this gene may be effective in the treatment of liver, kidney, and ovarian cancers.

Panel 4.1D Summary: Ag1294b Results from this experiment are in agreement with the expression profile in Panel 4D, with highest expression of the CG93871-01 gene in this

5   experiment in IL-4 treated dermal fibroblasts (CT=29.9). In addition, this experiment shows low but significant levels of expresion in resting neutrophils (CT=33.2), a sample absent in Panel 4D. Please see Panel 4D for discussion of utility of this gene in inflammation.

Panel 4D Summary: Ag1294b Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression of the CG93871-01

10   gene in IL-4 treated dermal fibroblasts (CTs=30). In addition, this gene is expressed at moderate levels in IFN gamma stimulated dermal fibroblasts, activated lung fibroblasts, HPAECs, lung and dermal microvasculature, activated small airway and bronchial epithelium, activated NCI-H292 cells, acutely activated T cells, and activated B cells.

Based on these levels of expression in T cells, activated B cells and cells in lung and skin,

15   therapeutics that block the function of this gene product may be useful as therapeutics that reduce or eliminate the symptoms in patients with autoimmune and inflammatory diseases in which activated B cells present antigens in the generation of the aberrant immune response and in treating T-cell mediated diseases, including Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, allergy, emphysema, rheumatoid

20   arthritis, or psoriasis.

Example D: Identification of Single Nucleotide Polymorphisms in NOVX nucleic acid sequences

Variant sequences are also included in this application. A variant sequence can include a single nucleotide polymorphism (SNP). A SNP can, in some instances, be referred

25   to as a "cSNP" to denote that the nucleotide sequence containing the SNP originates as a cDNA. A SNP can arise in several ways. For example, a SNP may be due to a substitution of one nucleotide for another at the polymorphic site. Such a substitution can be either a transition or a transversion. A SNP can also arise from a deletion of a nucleotide or an insertion of a nucleotide, relative to a reference allele. In this case, the polymorphic site is a

30   site at which one allele bears a gap with respect to a particular nucleotide in another allele. SNPs occurring within genes may result in an alteration of the amino acid encoded by the

411

gene at the position of the SNP. Intragenic SNPs may also be silent, when a codon including a SNP encodes the same amino acid as a result of the redundancy of the genetic code. SNPs occurring outside the region of a gene, or in an intron within a gene, do not result in changes in any amino acid sequence of a protein but may result in altered regulation of the expression

5   pattern. Examples include alteration in temporal expression, physiological response regulation, cell type expression regulation, intensity of expression, and stability of transcribed message.

SeqCalling assemblies produced by the exon linking process were selected and extended using the following criteria. Genomic clones having regions with 98% identity to

10   all or part of the initial or extended sequence were identified by BLASTN searches using the relevant sequence to query human genomic databases. The genomic clones that resulted were selected for further analysis because this identity indicates that these clones contain the genomic locus for these SeqCalling assemblies. These sequences were analyzed for putative coding regions as well as for similarity to the known DNA and protein sequences. Programs

15   used for these analyses include Grail, Genscan, BLAST, HMMER, FASTA, Hybrid and other relevant programs.

Some additional genomic regions may have also been identified because selected SeqCalling assemblies map to those regions. Such SeqCalling sequences may have overlapped with regions defined by homology or exon prediction. They may also be included

20   because the location of the fragment was in the vicinity of genomic regions identified by similarity or exon prediction that had been included in the original predicted sequence. The sequence so identified was manually assembled and then may have been extended using one or more additional sequences taken from CuraGen Corporation's human SeqCalling database. SeqCalling fragments suitable for inclusion were identified by the CuraTools™ program

25   SeqExtend or by identifying SeqCalling fragments mapping to the appropriate regions of the genomic clones analyzed.

The regions defined by the procedures described above were then manually integrated and corrected for apparent inconsistencies that may have arisen, for example, from miscalled bases in the original fragments or from discrepancies between predicted exon junctions, EST

30   locations and regions of sequence similarity, to derive the final sequence disclosed herein. When necessary, the process to identify and analyze SeqCalling assemblies and genomic clones was reiterated to derive the full length sequence (Alderborn et al., Determination of Single Nucleotide Polymorphisms by Real-time Pyrophosphate DNA Sequencing. Genome Research. 10 (8) 1249-1265, 2000).

412

Variants are reported individually but any combination of all or a select subset of variants are also included as contemplated NOVX embodiments of the invention.

RESULTS:

5   **NOV2a SNP Data**

Two polymorphic variants of NOV2a have been identified and are shown in Table 28A.

OTHER EMBODIMENTS

5 Although particular embodiments have been disclosed herein in detail, this has been done by
way of example for purposes of illustration only, and is not intended to be limiting with
respect to the scope of the appended claims, which follow. In particular, it is contemplated
by the inventors that various substitutions, alterations, and modifications may be made to the
invention without departing from the spirit and scope of the invention as defined by the

10 claims. The choice of nucleic acid starting material, clone of interest, or library type is
believed to be a matter of routine for a person of ordinary skill in the art with knowledge of
the embodiments described herein. The claims presented are representative of the inventions
disclosed herein. Other, unclaimed inventions are also contemplated. Applicants reserve the
right to pursue such inventions in later claims.

CLAIMS

We claim:

1. An isolated polypeptide comprising an amino acid sequence selected from the group consisting of:

   a) a mature form of the amino acid sequence selected from the group consisting of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46;

   b) a variant of a mature form of the amino acid sequence selected from the group consisting of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46, wherein any amino acid in the mature form is changed to a different amino acid, provided that no more than 15% of the amino acid residues in the sequence of the mature form are so changed;

   c) the amino acid sequence selected from the group consisting of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46;

   d) a variant of the amino acid sequence selected from the group consisting of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46, wherein any amino acid specified in the chosen sequence is changed to a different amino acid, provided that no more than 15% of the amino acid residues in the sequence are so changed; and

   e) a fragment of any of a) through d).

2. The polypeptide of claim 1 that is a naturally occurring allelic variant of the sequence selected from the group consisting of SEQ ID NO:2*n*, wherein *n* is an integer between 1-46.

3. The polypeptide of claim 2, wherein said allelic variant comprises an amino acid sequence that is the translation of a nucleic acid sequence differing by a single nucleotide from a nucleic acid sequence selected from the group consisting of SEQ ID NO:2*n*-1, wherein *n* is an integer between 1-46.

4. The polypeptide of claim 1 that is a variant polypeptide described therein, wherein any amino acid specified in the chosen sequence is changed to provide a conservative substitution.

417

5.   A pharmaceutical composition comprising the polypeptide of claim 1 and a
        pharmaceutically acceptable carrier.

6.   A kit comprising in one or more containers, the pharmaceutical composition of claim
        5.

7.   The use of a therapeutic in the manufacture of a medicament for treating a syndrome
        associated with a human disease, the disease selected from a pathology associated
        with the polypeptide of claim 1, wherein said therapeutic is the polypeptide of claim
        1.

8.   A method for determining the presence or amount of the polypeptide of claim 1 in a
        sample, the method comprising:
        (a)   providing said sample;
        (b)   introducing said sample to an antibody that binds immunospecifically to the
                polypeptide; and
        (c)   determining the presence or amount of antibody bound to said polypeptide,
        thereby determining the presence or amount of polypeptide in said sample.

9.   A method for determining the presence of or predisposition to a disease associated
        with altered levels of the polypeptide of claim 1 in a first mammalian subject, the
        method comprising:
        a)   measuring the level of expression of the polypeptide in a sample from the first
                mammalian subject; and
        b)   comparing the amount of said polypeptide in the sample of step (a) to the
                amount of the polypeptide present in a control sample from a second
                mammalian subject known not to have, or not to be predisposed to, said
                disease,
        wherein an alteration in the expression level of the polypeptide in the first subject as
        compared to the control sample indicates the presence of or predisposition to said
        disease.

418

10.   A method for modulating the activity of the polypeptide of claim 1, the method comprising introducing a cell sample expressing the polypeptide of said claim with an antibody that binds to said polypeptide in an amount sufficient to modulate the activity of the polypeptide.

11.   The method of claim 10, wherein said subject is a human.

12.   An isolated nucleic acid molecule comprising a nucleic acid sequence encoding a polypeptide comprising an amino acid sequence selected from the group consisting of:

a)   a mature form of the amino acid sequence of SEQ ID NO:$2n$, wherein n is an integer between 1-46;

b)   a variant of a mature form of the amino acid sequence selected from the group consisting of SEQ ID NO:$2n$, wherein n is an integer between 1-46, wherein any amino acid in the mature form of the chosen sequence is changed to a different amino acid, provided that no more than 15% of the amino acid residues in the sequence of the mature form are so changed;

c)   the amino acid sequence selected from the group consisting of SEQ ID NO:$2n$, wherein n is an integer between 1-46;

d)   a variant of the amino acid sequence selected from the group consisting of SEQ ID NO:$2n$, wherein n is an integer between 1-46, in which any amino acid specified in the chosen sequence is changed to a different amino acid, provided that no more than 15% of the amino acid residues in the sequence are so changed;

e)   a nucleic acid fragment encoding at least a portion of a polypeptide comprising the amino acid sequence selected from the group consisting of SEQ ID NO:$2n$, wherein n is an integer between 1-46, or any variant of said polypeptide wherein any amino acid of the chosen sequence is changed to a different amino acid, provided that no more than 10% of the amino acid residues in the sequence are so changed; and

f)   the complement of any of said nucleic acid molecules.

13.   The nucleic acid molecule of claim 12, wherein the nucleic acid molecule comprises the nucleotide sequence of a naturally occurring allelic nucleic acid variant.

14. The nucleic acid molecule of claim 12 that encodes a variant polypeptide, wherein the variant polypeptide has the polypeptide sequence of a naturally occurring polypeptide variant.

15. The nucleic acid molecule of claim 12, wherein the nucleic acid molecule differs by a single nucleotide from a nucleic acid sequence selected from the group consisting of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46.

16. The nucleic acid molecule of claim 12, wherein said nucleic acid molecule comprises a nucleotide sequence selected from the group consisting of
   a) the nucleotide sequence selected from the group consisting of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46;
   b) a nucleotide sequence wherein one or more nucleotides in the nucleotide sequence selected from the group consisting of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, is changed from that selected from the group consisting of the chosen sequence to a different nucleotide provided that no more than 15% of the nucleotides are so changed;
   c) a nucleic acid fragment of the sequence selected from the group consisting of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46; and
   d) a nucleic acid fragment wherein one or more nucleotides in the nucleotide sequence selected from the group consisting of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, is changed from that selected from the group consisting of the chosen sequence to a different nucleotide provided that no more than 15% of the nucleotides are so changed.

17. The nucleic acid molecule of claim 12, wherein said nucleic acid molecule hybridizes under stringent conditions to the nucleotide sequence selected from the group consisting of SEQ ID NO:$2n$-1, wherein n is an integer between 1-46, or a complement of said nucleotide sequence.

18. The nucleic acid molecule of claim 12, wherein the nucleic acid molecule comprises a nucleotide sequence in which any nucleotide specified in the coding sequence of the chosen nucleotide sequence is changed from that selected from the group consisting

420

of the chosen sequence to a different nucleotide provided that no more than 15% of the nucleotides in the chosen coding sequence are so changed, an isolated second polynucleotide that is a complement of the first polynucleotide, or a fragment of any of them.

19. A vector comprising the nucleic acid molecule of claim 12.

20. The vector of claim 19, further comprising a promoter operably linked to said nucleic acid molecule.

21. A cell comprising the vector of claim 20.

22. A method for determining the presence or amount of the nucleic acid molecule of claim 12 in a sample, the method comprising:

(a) providing said sample;

(b) introducing said sample to a probe that binds to said nucleic acid molecule; and

(c) determining the presence or amount of said probe bound to said nucleic acid molecule,

thereby determining the presence or amount of the nucleic acid molecule in said sample.

23. The method of claim 22 wherein presence or amount of the nucleic acid molecule is used as a marker for cell or tissue type.

24. The method of claim 23 wherein the cell or tissue type is cancerous.

25. A method for determining the presence of or predisposition to a disease associated with altered levels of the nucleic acid molecule of claim 12 in a first mammalian subject, the method comprising:

a) measuring the amount of the nucleic acid in a sample from the first mammalian subject; and

b)   comparing the amount of said nucleic acid in the sample of step (a) to the

amount of the nucleic acid present in a control sample from a second

mammalian subject known not to have or not be predisposed to, the disease;

wherein an alteration in the level of the nucleic acid in the first subject as compared to

the control sample indicates the presence of or predisposition to the disease.

26.   An antibody that binds immunospecifically to the polypeptide of claim 1.

27.   The antibody of claim 26, wherein said antibody is a monoclonal antibody.

28.   The antibody of claim 26, wherein the antibody is a humanized antibody.

29.   The antibody of claim 26, wherein the antibody is a fully human antibody

30.   The antibody of claim 26, wherein the dissociation constant for the binding of the

polypeptide to the antibody is less than 1×10^{-9} M.

31.   The antibody of claim 26, wherein the antibody neutralizes an activity of the

polypeptide.

32.   A pharmaceutical composition comprising the antibody of claim 26 and a

pharmaceutically acceptable carrier.

33.   A kit comprising in one or more containers, the pharmaceutical composition of claim

29.

34.   The use of a therapeutic in the manufacture of a medicament for treating a syndrome

associated with a human disease, the disease selected from a pathology associated

with the polypeptide of claim 1, wherein said therapeutic is a NOVX antibody.

35.   A method of treating or preventing a NOVX-associated disorder, said method

comprising administering to a subject in which such treatmnet or prevention is desired

the antibody of claim 26 in an amount sufficient to treat or prevent said NOVx-

associated disorder in said subject.

422

36.   A method of treating a pathological state in a mammal, the method comprising
       administering to the mammal the antibody of claim 26 in an amount sufficient to
       alleviate the pathological state.

37.   A method of treating or preventing a pathology associated with the polypeptide of
       claim 1, said method comprising administering to a subject in which such treatment or
       prevention is desired a NOVX antibody in an amount sufficient to treat or prevent
       said pathology in said subject.

38.   The method of claim 37, wherein the subject is a human.

(71) Applicant (for all designated States except US): CURAGEN CORPORATION [US/US]; 11th Floor, 555 Long Wharf Drive, New Haven, CT 06511 (US).

(54) Title: NOVEL ANTIBODIES THAT BIND TO ANTIGENIC POLYPEPTIDES, NUCLEIC ACIDS ENCODING THE ANTIGENS, AND METHODS OF USE

(57) Abstract: Disclosed herein are nucleic acid sequences that encode polypeptides. Also disclosed are antibodies, which immunospecifically-bind to the polypeptide, as well as derivatives, variants, mutants, or fragments of the aforementioned polypeptide, polynucleotide, or antibody. The invention further discloses therapeutic, diagnostic and research methods for diagnosis, treatment, and prevention of disorders involving any one of these novel human nucleic acids, polypeptides, or antibodies, or fragments thereof.

(72) Inventors; and

(75) Inventors/Applicants *(for US only)*: **PADIGARU, Mu-ralidhara** [IN/US]; 71 Hampton Park, Branford, CT 06405 (US). **SHENOY, Suresh, G.** [IN/US]; 15 Millwood Drive, Branford, CT 06405 (US). **KEKUDA, Ramesh** [IN/US]; 1213 Avalon Valley Drive, Danbury, CT 06810 (US). **RASTELLI, Luca** [IT/US]; 52 Pepperbush Lane, Guilford, CT 06437 (US). **MEZES, Peter, S.** [CA/US]; 7 Clark's lane, Old Lyme, CT 06371 (US). **SMITHSON, Glennda** [US/US]; 125 Michael Drive, Guildford, CT 06435 (US). **GUO, Xiaojia** [CN/US]; 713 Robert Frost Drive, Branford, CT 06405 (US). **GERLACH, Valerie** [US/US]; 18 Rock Pasture Road, Branford, CT 06405 (US). **CASMAN, Stacie, J.** [US/US]; 17 Peck Street, North Haven, CT 06473 (US). **BOLDOG, Ferenc, L.** [HU/US]; 1687 Hartford Turnpike, North Haven, CT 06473 (US). **LI, Li** [CN/US]; 56 Jerimoth Drive, Branford, CT 06405 (US). **ZERHUSEN, Bryan, D.** [US/US]; 337 Monticello Drive, Branford, CT 06405 (US). **TCHERNEV, Velizar, T.** [BG/US]; 45 Jefferson Road #3-12, Branford, CT 06405 (US). **GANGOLLI, Esha, A.** [IN/US]; 31 Strawberry Hill Road, Madison, CT 06443 (US). **VERNET, Corine, A., M.** [FR/US]; 1739 Foxon Road, Apartment L6, Branford, CT 06471 (US). **SPYTEK, Kimberly, A.** [US/US]; 28 Court Street, Number 1, New Haven, CT 06511 (US). **MALYANKAR, Uriel, M.** [IN/US]; 229 Branford Road, Number 330, Branford, CT 06405 (US). **PATTURA-JAN, Meera** [IN/US]; 45 Harrison Avenue, Apartment 1C, Branford, CT 06405 (US). **MILLER, Charles, E.** [US/US]; 98 Saddle Hill Drive, Guilford, CT 06437 (US). **TAUPIER, Raymond, J., Jr.** [US/US]; 34 Pardee Place Extension, East Haven, CT 06512 (US). **HEYES, Melvyn, P.** [GB/US]; 183 Townsend Avenue, Number 3, New Haven, CT 06512 (US). **JU, Jingfang** [US/US]; 391 Rosebud Lane, Orange, CT 06477 (US). **PEYMAN, John, A.** [US/US]; 336 West Rock Avenue, New Haven, CT 06515 (US). **CATTERTON, Elina** [FI/US]; 584 Boston Post Road, Madison, CT 06443 (US). **MACDOUGALL, John, R.** [CA/US]; 117 Russell Street, Hamden, CT 06517 (US). **EDINGER, Shlomit, R.** [US/US]; 766 Edgewood Avenue, New Haven, CT 06515 (US). **STONE, David, J.** [US/US]; 223 Whitethorn Drive, Guilford, CT 06437 (US). **MAZUR, Ann** [US/US]; 35 Burr Road, Bloomfield, CT 06002 (US).

(74) Agent: ELRIFI, Ivor, R.; Mintz, Levin, Cohn, Ferris, Glovsky and Popeo, P.C., One Financial Center, Boston, MA 02111 (US).

(81) Designated States *(national)*: AE, AG, AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, BZ, CA, CH, CN, CO, CR, CU, CZ, DE, DK, DM, DZ, EC, EE, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MA, MD, MG, MK, MN, MW, MX, MZ, NO, NZ, OM, PH, PL, PT, RO, RU, SD, SE, SG, SI, SK, SL, TJ, TM, TN, TR, TT, TZ, UA, UG, US, UZ, VN, YU, ZA, ZM, ZW.

(84) Designated States *(regional)*: ARIPO patent (GH, GM, KE, LS, MW, MZ, SD, SL, SZ, TZ, UG, ZM, ZW), Eurasian patent (AM, AZ, BY, KG, KZ, MD, RU, TJ, TM), European patent (AT, BE, CH, CY, DE, DK, ES, FI, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE, TR), OAPI patent (BF, BJ, CF, CG, CI, CM, GA, GN, GQ, GW, ML, MR, NE, SN, TD, TG).

(88) Date of publication of the international search report:
22 May 2003

For two-letter codes and other abbreviations, refer to the "Guidance Notes on Codes and Abbreviations" appearing at the beginning of each regular issue of the PCT Gazette.

INTERNATIONAL SEARCH REPORT

A.   CLASSIFICATION OF SUBJECT MATTER
    IPC(7)   :   A61K 38/16
    US CL   :   530/300; 514/02
According to International Patent Classification (IPC) or to both national classification and IPC

B.   FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
    U.S. : 530/300; 514/02

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)
Sequence Search

C.   DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	Database SwissProt_40. Assession Number P70549. Sequence of Sodium/Calcium	1-4
---	exchanger precursor. 01 November 1997. See sequence allignment.	---
Y		5-7

☐ Further documents are listed in the continuation of Box C.   ☐   See patent family annex.

*	Special categories of cited documents:	"T"	later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
"A"	document defining the general state of the art which is not considered to be of particular relevance		
"E"	earlier application or patent published on or after the international filing date	"X"	document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
"L"	document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"Y"	document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
"O"	document referring to an oral disclosure, use, exhibition or other means		
"P"	document published prior to the international filing date but later than the priority date claimed	"&"	document member of the same patent family

Date of the actual completion of the international search	Date of mailing of the international search report
07 March 2003 (07.03.2003)	2 0 MAR 2003
Name and mailing address of the ISA/US	Authorized officer
Commissioner of Patents and Trademarks Box PCT Washington, D.C. 20231 Facsimile No. (703)305-3230	Michael Borin Telephone No. (703) 308-0196

Form PCT/ISA/210 (second sheet) (July 1998)

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US02/10366

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claim Nos.:
   because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claim Nos.:
   because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claim Nos.:
   because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:
Please See Continuation Sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.: 1-7

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

Form PCT/ISA/210 (continuation of first sheet(1)) (July 1998)

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING

Group I, claims 1-6, drawn to polypeptides.

Group II, claim 7, drawn to method of use of polypeptide for manufacturing medicament.

Group III, claim 9, drawn to method of use of polypeptide for determining presence of disease.

Group IV, claims 12-18, drawn to nucleic acids, vectors, host cells, method of making recombinant cell using said nucleic acids.

Group V, claims 22-24, drawn to method of use of a probe to determine presence of a polynucleotide of Group IV.

Group VI, claim 25, drawn to method of use of polynucleotide for determining presence of a disease.

Group VII, claims 26-33, drawn to antibody.

Group VIII, claim 34, drawn to method of use of antibody for manufacturing medicament.

Group IX, claim 35, drawn to method of use of antibody for treating disorder.

Group X, claim 36, drawn to method of use of antibody for treating a pathological state.

Group XI, claims 37,38, drawn to method of use of antibody for preventing pathology.

ethod of use of antibody for determining presence of polypeptide of Group I.

method of use of antibody for modulating activity of polypeptide of Group I.

Sequence Election Requirement Applicable to All Groups

In addition, each Group detailed above reads on distinct Groups drawn to multiple sequences which do not have common core structure (sequences ID Nos 2,4,6,8,...92 for polypeptides; sequences SEQ ID Nos. 1,3,5,7,9...91 for polynucleotides). Thus, each of the above group is further divided into 46 independent groups. The lack of unity is partially waived and the Applicants must further elect one sequence for examination in the elected Group detailed above. Payment of fees for an additional invention will entitle the Applicants to examination of four additional sequences.

The inventions listed as Groups I-X do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: The inventions listed as Groups I, IV, VII are drawn to different products which lack the same or corresponding special technical features. Groups II, III are different methods of use of polypeptide of Group I. Groups V, VII are different methods of use of polynucleotide of Group IV. Groups VIII-XIII are different methods of use of antibodies of Group VII.

For the product elected, the first method of making/use will be examined together with the product.
